GAZAARABIA

Developer handover

Simple instructions. Necessary UI designs. Technical details in one reference section.

The product we are building

A premium modest-fashion shopping experience, supported by a reliable Seller Centre and Super Admin. Keep Gazaarabia identity and use ASOS/JD Sports as direction for discovery, presentation and membership.

Read first

Pages 3-11: the work to complete, grouped into nine clear sections.

Use when needed

Pages 12-36: example screens for the customer website, sellers and admin.

Developer detail

Pages 37-45: data, integrations, accounting, permissions and release tests.

Version 5 / 22 October 2026 / Existing bugs and proposed features must be checked against the current website.

Build order and contents

Keep this page as the shared plan. Mark each section Done, Blocked or Still to do.

1. **Fix the shopping experience** 3
2. **Make product listing easy** 4
3. **Connect existing seller stores** 5
4. **Fix orders, payments and accounting** 6
5. **Simplify Seller Centre and Super Admin** 7
6. **Add promotions and marketing** 8
7. **Build the premium fashion experience** 9
8. **Finish blogs, SEO and technical checks** 10
9. **Complete the customer journey** 11

Start now

Confirm the current code and a working test site. Reproduce the reported bugs. Review seller access, uploads, stock and payment integrity immediately. Then fix shopping, listing and media before adding growth tools.

For every completed change: show the working result, test the failure case, and record any migration or release steps. Keep working features and existing product/order identities.

Reported issues are not all confirmed defects. These are design and implementation instructions; the website has not been changed by this document. Advanced tools marked Later can wait.

1. Fix the shopping experience

Start with the problems customers can see.

- [ ] Make Women, Men and every category menu open the correct products.
- [ ] Fix product filters, sorting and pagination. Keep the selection when customers return to the listing.
- [ ] Make the Back button return to the previous page with one click.
- [ ] Show the correct product and variant images everywhere. Repair broken image links.
- [ ] Add image swipe, previous/next controls and a clear full-screen close button.
- [ ] Fix overlapping sidebars, gallery zoom and the homepage header. Confirm which sidebar should be removed.
- [ ] Use one shipping rule across the website. Fix incorrect totals and long decimal numbers.
- [ ] Show size, fabric, seller, delivery time and return information before purchase.
- [ ] Show one popup at a time. Keep cookie choices and newsletter prompts from covering each other.
- [ ] Check public impact figures and contribution claims. Use approved, dated figures consistently.

UI examples: C01 p28, C03 p30

Check: Browse, filter, open a product and return on mobile and desktop without broken images or overlapping controls.

2. Make product listing easy

Keep the editor simple. Product and media designs are on pages 14-15.

- [ ] Put categories in a fixed parent-to-child order. Add category search and allow valid categories without subcategories.
- [ ] Keep product URLs working after edits. Redirect the old URL when a published URL is deliberately changed.
- [ ] Add Save Draft, autosave, Preview and Publish. Keep incomplete drafts private.
- [ ] Store the right SKU, price, stock, size, colour and image for every variant.
- [ ] Allow image reordering and one main image. If it is deleted, select the next valid image.
- [ ] Fix video upload, save and playback. Show supported formats, progress and a useful error message.
- [ ] Keep uploaded images and videos available after website updates or server restarts.
- [ ] Add bulk editing and import. Show errors and preview changes before applying them.
- [ ] Highlight missing information before publishing. Let admin approve or return listings with a clear reason.
- [ ] Require useful modest-fashion details: length, sleeves, neckline, lining, opacity, fabric and measurements.
- [ ] Use consistent photo sizes, accurate colours, detail shots and model measurements across brands.

UI examples: S02 p13, S03 p14, S04 p15, A03 p24

Check: Create a draft, add variants and media, publish, edit and reopen it. The URL, cover image and stock must remain correct.

3. Connect existing seller stores

Connect once, then make updates and problems easy to track.

- [ ] Find the exact Shopify approval or connection error and fix the supported connection process.
- [ ] Finish the WooCommerce connection for all selected products and variants.
- [ ] Let sellers choose which products to import and map their categories before publication.
- [ ] Set which website controls stock, prices, descriptions and images. Show where each value comes from.
- [ ] Update stock from store events and run regular checks to catch missed changes.
- [ ] Send each seller order to the correct store once. Bring dispatch and tracking updates back.
- [ ] Show connection status, last successful update, failed items, reconnect and retry.
- [ ] Prevent duplicate orders and stock changes when an event or retry arrives more than once.
- [ ] Build a reusable connection process. Add other platforms when sellers actually need them.

UI examples: S05 p16, S06 p17

Check: Import products, change stock, place an order and update tracking in a test store. Repeat an event and confirm nothing duplicates.

4. Fix orders, payments and accounting

Agree fees, tax treatment and payout rules with the accountant before final setup.

- [ ] Reserve stock during checkout and release it after failed or expired payment. Prevent overselling.
- [ ] Split a mixed basket into seller orders. Show separate deliveries within one customer order.
- [ ] Keep payment, dispatch, delivery and refund statuses separate. Support partial shipments and tracking.
- [ ] Handle returns and refunds per item. Use the original paid amount and discount allocation.
- [ ] Keep a transaction record for sales, fees, commission, discounts, refunds and adjustments.
- [ ] Show pending funds, available funds, payout dates, holds and failed payouts.
- [ ] Match orders and balances to payment-provider records and bank settlements. Flag differences.
- [ ] Give sellers clear settlement statements, commission invoices and credit notes where applicable.
- [ ] Connect approved records to accounting software. Prevent duplicate exports and show failed transfers.
- [ ] Show profit estimates only when cost information exists. Lock completed accounting periods and record later corrections.
- [ ] Track platform-funded offers, rewards, creator commissions and any impact contributions separately.

UI examples: S07 p18, S08 p19, S09 p20, S14 p22, A10 p27, C02 p29

Check: A paid order, partial refund and payout must match the seller statement, payment records and accounting totals.

5. Simplify Seller Centre and Super Admin

Show people what needs doing next.

- [ ] Replace confusing dashboard figures with accurate sales, order, product, variant and review information.
- [ ] Put urgent tasks first: dispatch, returns, drafts, low stock and connection errors.
- [ ] Add a seller setup checklist for verification, payments, shipping, store connection and first listing.
- [ ] Send useful alerts that open the exact task. Add notification preferences.
- [ ] Keep customer messages, return evidence and support history with the relevant order or case.
- [ ] Let admin approve sellers, review listings and monitor late dispatch, cancellations and stock accuracy.
- [ ] Give super admin a clear view of seller activity, problem orders, disputes, payouts and system failures.
- [ ] Give staff only the access they need. Record sensitive changes and require reasons for financial adjustments.
- [ ] Show seller sales, returns, promotion results and exports with clear dates and definitions.
- [ ] Keep the existing navy/red design. Use short menus, clear labels and simple mobile layouts.

UI examples: S01 p12, A01 p23, A07 p26

Check: Every dashboard alert opens the right task. Seller staff cannot access data belonging to other sellers or restricted finance controls.

6. Add promotions and marketing

Start with simple discounts. Add more tools when the money rules are tested.

- [ ] Let sellers create discounts and coupons for their own products.
- [ ] Add dates, minimum spend, usage limits, budgets and clear rules for combining offers.
- [ ] Show who pays for every discount: seller, Gazaarabia or both.
- [ ] Let admin create campaigns and sellers submit products for approval.
- [ ] Add bundles and complete-outfit offers with correct stock and refund calculations.
- [ ] Add creator invitations, samples, agreed content rights and commission tracking. Fix referral attribution.
- [ ] Report redemptions, paid sales, discount costs, returns and commissions accurately.
- [ ] Add stock alerts and relevant follow-up messages. Respect preferences and stop reminders after purchase.
- [ ] Later: add membership rewards with clear earning, expiry, funding and refund rules.
- [ ] Later: add scheduled launches and member access. Use real availability and enforce access properly.

UI examples: S10 p21

Check: In a mixed basket, a seller coupon discounts only eligible items from that seller. Refunds reverse the correct costs and rewards.

7. Build the premium fashion experience

Aim for one polished Gazaarabia fashion destination, with ASOS and JD Sports as references.

- [ ] Build an editorial homepage with one strong campaign, curated collections and clear navigation.
- [ ] Let marketing schedule banners, collections and stories together, with preview and rollback.
- [ ] Create occasion edits such as workwear, everyday essentials, travel and Eid.
- [ ] Improve fashion search with useful size, length, colour, fabric and occasion filters.
- [ ] Let customers save products and outfits into named collections. Make shared links revocable.
- [ ] Show coordinated looks and let customers choose a size for each item before adding it.
- [ ] Add verified-purchase reviews and optional fit feedback. Show honest empty review states.
- [ ] Later: add size guidance and personalised recommendations when reliable measurements and data are available.
- [ ] Later: consider photo search. Keep AI suggestions reviewable and never invent materials or measurements.
- [ ] Track missing sizes, unsuccessful searches and returns. Test changes against purchases and costs.

UI examples: C04 p31, C05 p32, C06 p33

Check: The site looks consistent across brands, loads smoothly and clearly explains fit, delivery and returns before purchase.

8. Finish blogs, SEO and technical checks

Complete these checks alongside the relevant fixes. Keep advanced infrastructure proportionate.

- [ ] Fix blog background images and pasted formatting. Use supported blocks, managed images, drafts and preview.
- [ ] Show short blog excerpts in cards. Remove duplicated page headers and unsafe pasted code.
- [ ] Fix broken links, redirects and sitemap paths. Keep drafts out and remove catalogue-size limits.
- [ ] Add correct page titles, descriptions, sharing images and product/article data. Check shopping feeds.
- [ ] Make analytics and newsletter choices follow customer preferences. Count purchases and referrals once.
- [ ] Make the site fast and usable on mobile, keyboard and browser zoom. Fix poor loading and error states.
- [ ] Protect seller data, staff roles and uploads. Fix affiliate/ambassador access rules and remove sensitive logs.
- [ ] Make imports and scheduled work survive failures. Monitor errors and provide safe retries.
- [ ] Back up data and media, test restoration, and use a test site before releasing changes.
- [ ] Test listing, purchase, stock, dispatch, refund and payout together before closing the work.
- [ ] Add languages, currencies or collection points only when the business supports them. Set data-retention and deletion rules.

UI examples: A05 p25

Check: Show a working test of each completed fix. Keep a short record: Done, Blocked or Still to do, with the reason.

9. Complete the customer journey

Add these with the core checkout, order and return work. They are included in this version.

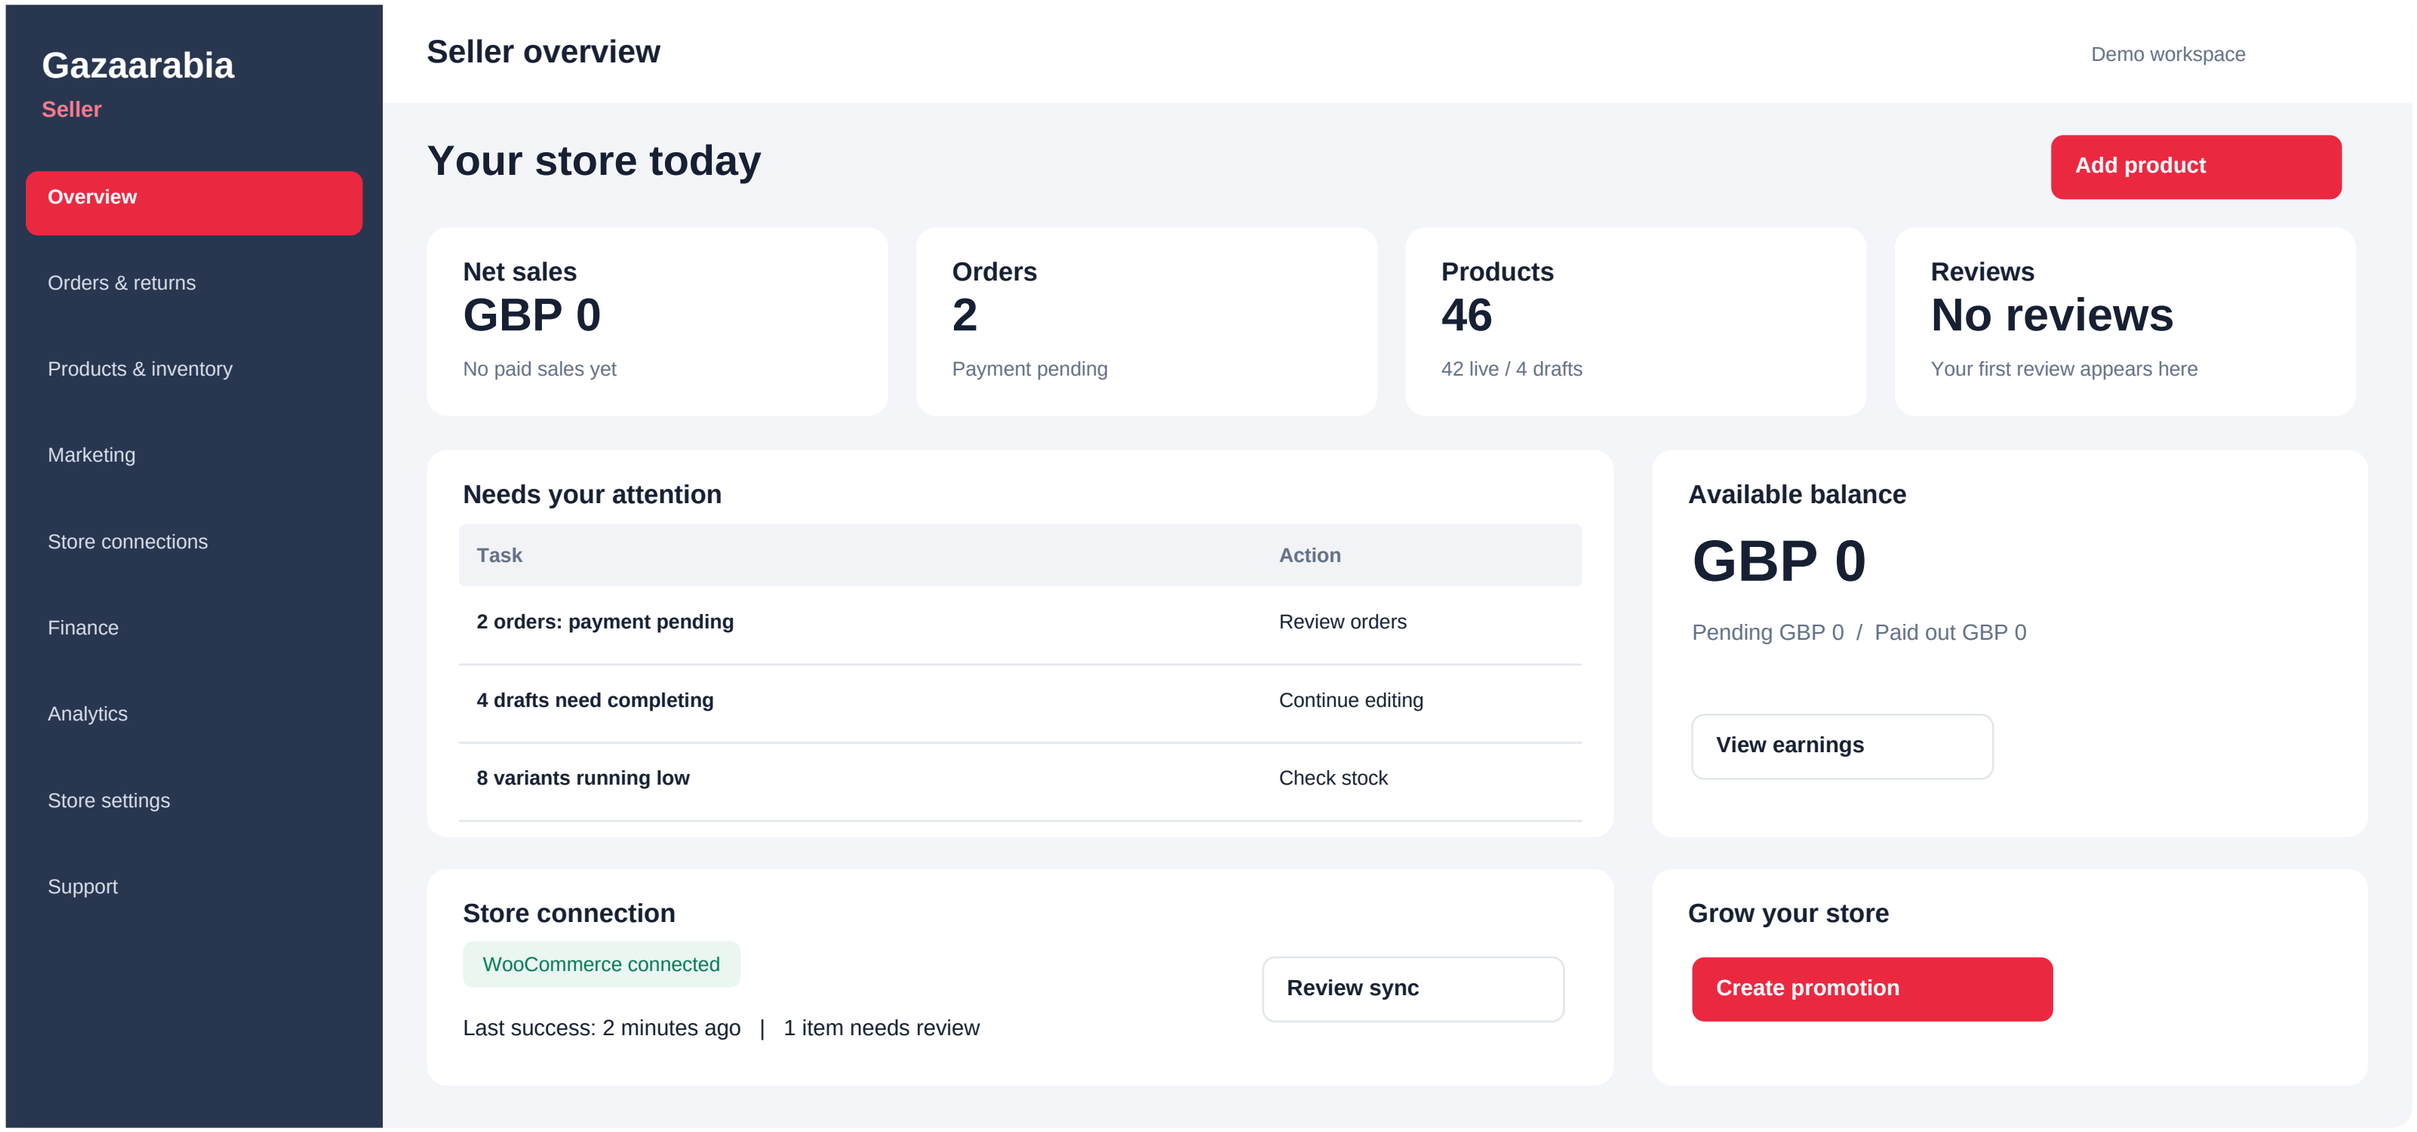

- [ ] Let customers check out as guests. Offer account creation after purchase and secure guest order access.
- [ ] Add mobile-friendly address lookup with manual entry, express payments where supported, and clear retry errors.
- [ ] Keep the shopping bag across visits. Restore selected sizes/colours and explain stock or price changes.
- [ ] Give customers one order centre for parcels, delivery updates, returns, refund progress and support.
- [ ] Offer size exchanges where supported. Check replacement stock and show all return or delivery charges first.
- [ ] Add late, missing, wrong and damaged item reports with evidence upload, case status and clear next steps.
- [ ] Use one Gazaarabia support contact. Route cases to sellers internally and let admin intervene when overdue.
- [ ] Allow cancellation or corrections only while the order and connected store can safely accept them.
- [ ] Show return eligibility, costs, destination and processing stages before purchase and in the return flow.
- [ ] Add consistent brand profiles and following, with relevant new-arrival notifications controlled by preferences.
- [ ] Let customers update preferred sizes, lengths, followed brands and notification choices in one place.

UI examples: C07 p34, C08 p35, C09 p36. Implementation detail: Reference 9 p45.

Check: A guest can buy, track a parcel, report a problem and request a supported exchange without losing their order history.

S01 / Seller overview

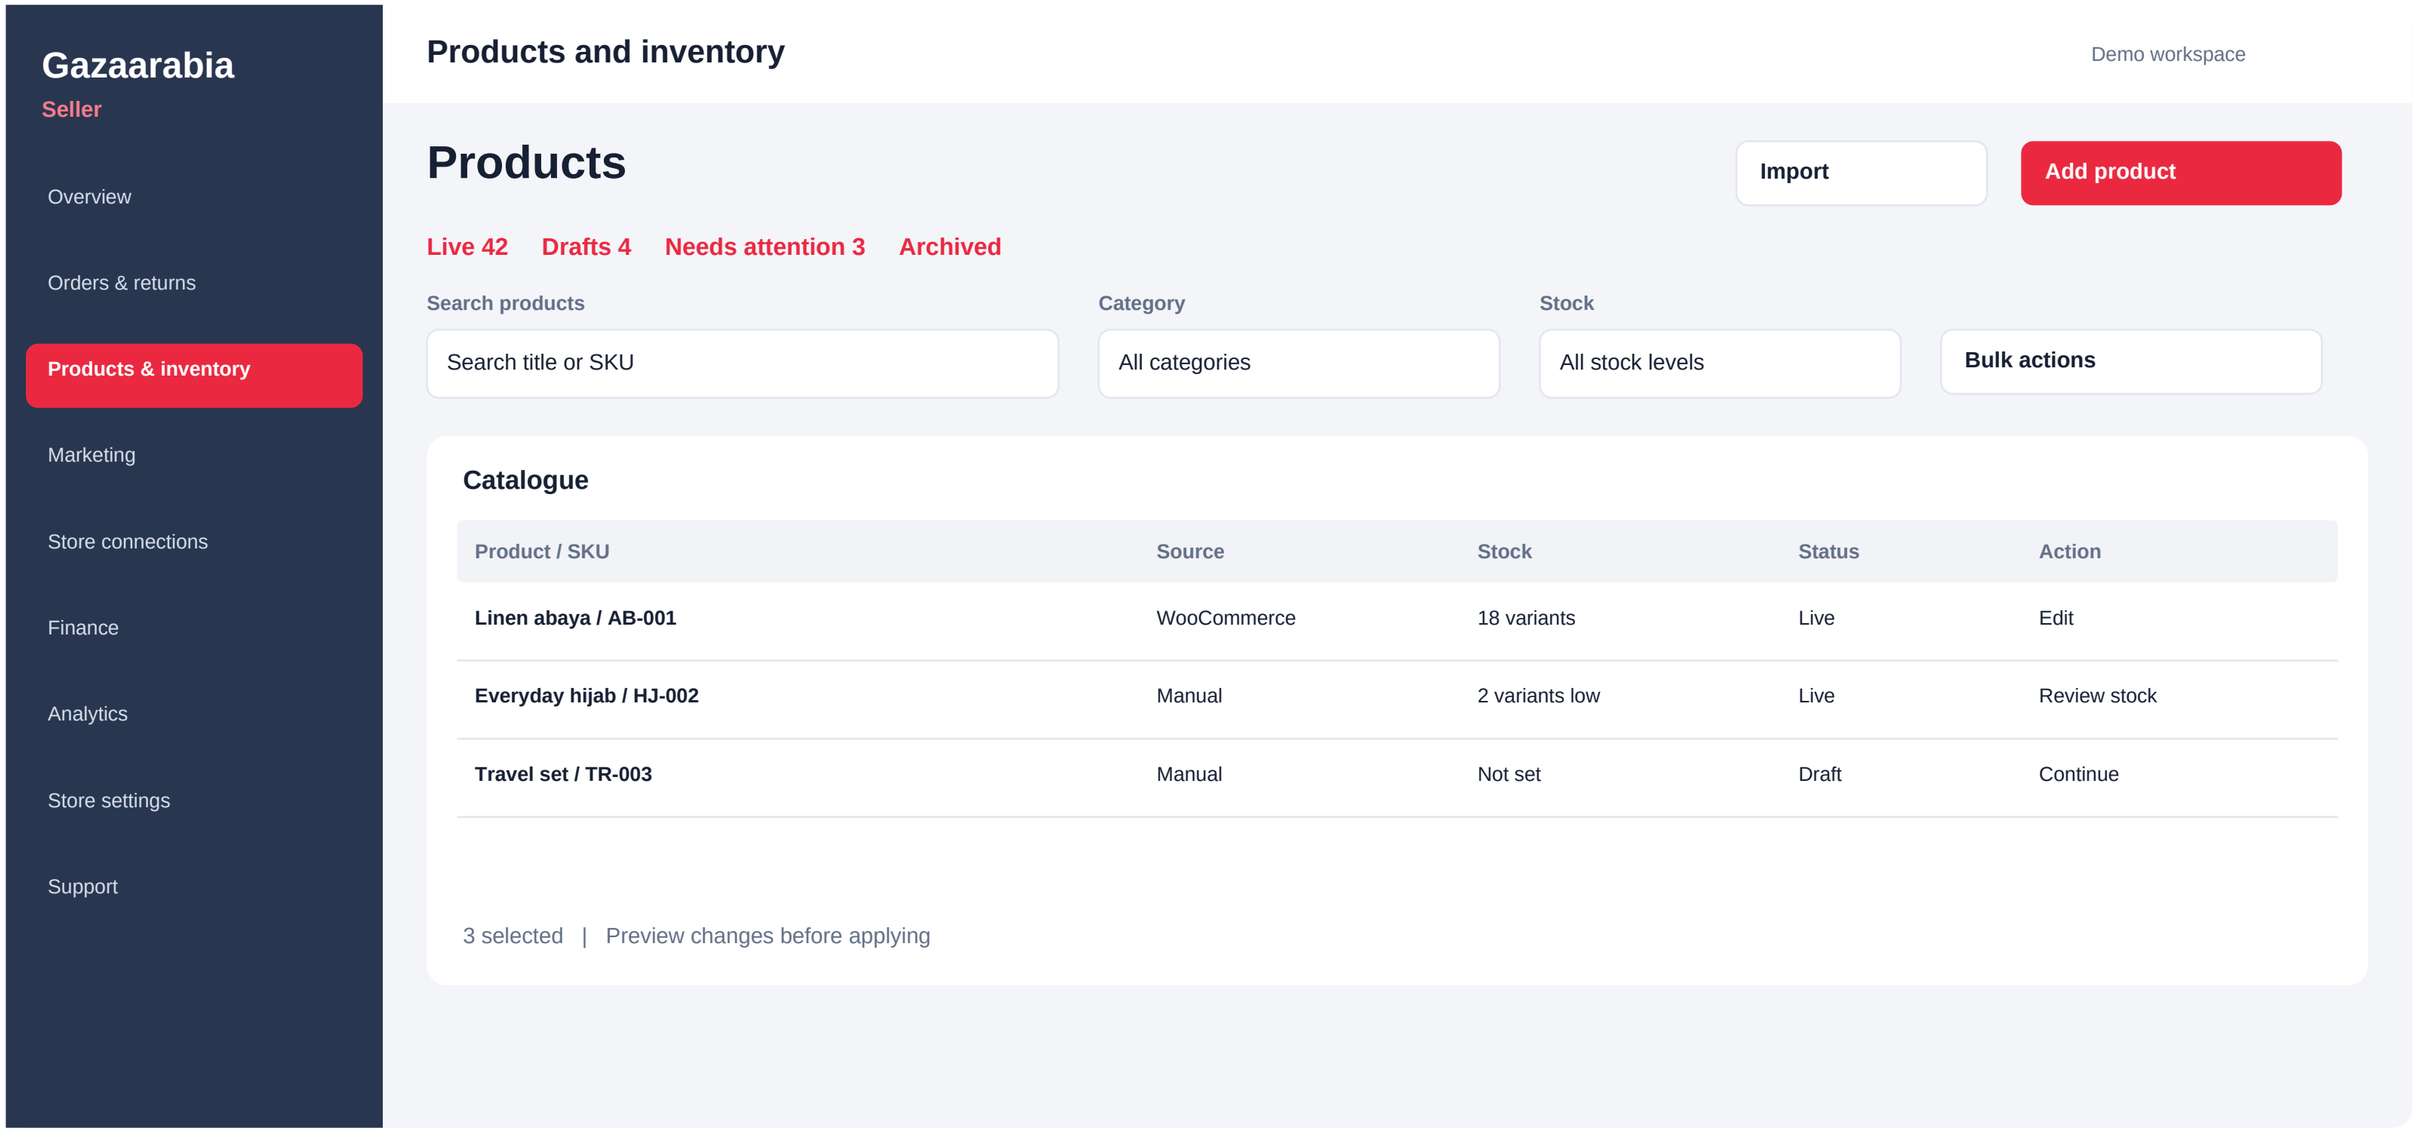

Use with checklist section 5. Example layout and demo values; adapt existing working components.

1. Put urgent tasks above decorative charts.
2. Use accurate metrics and link each alert to its work list.
3. Show no-sales/no-reviews states without false growth.

S02 / Products and inventory

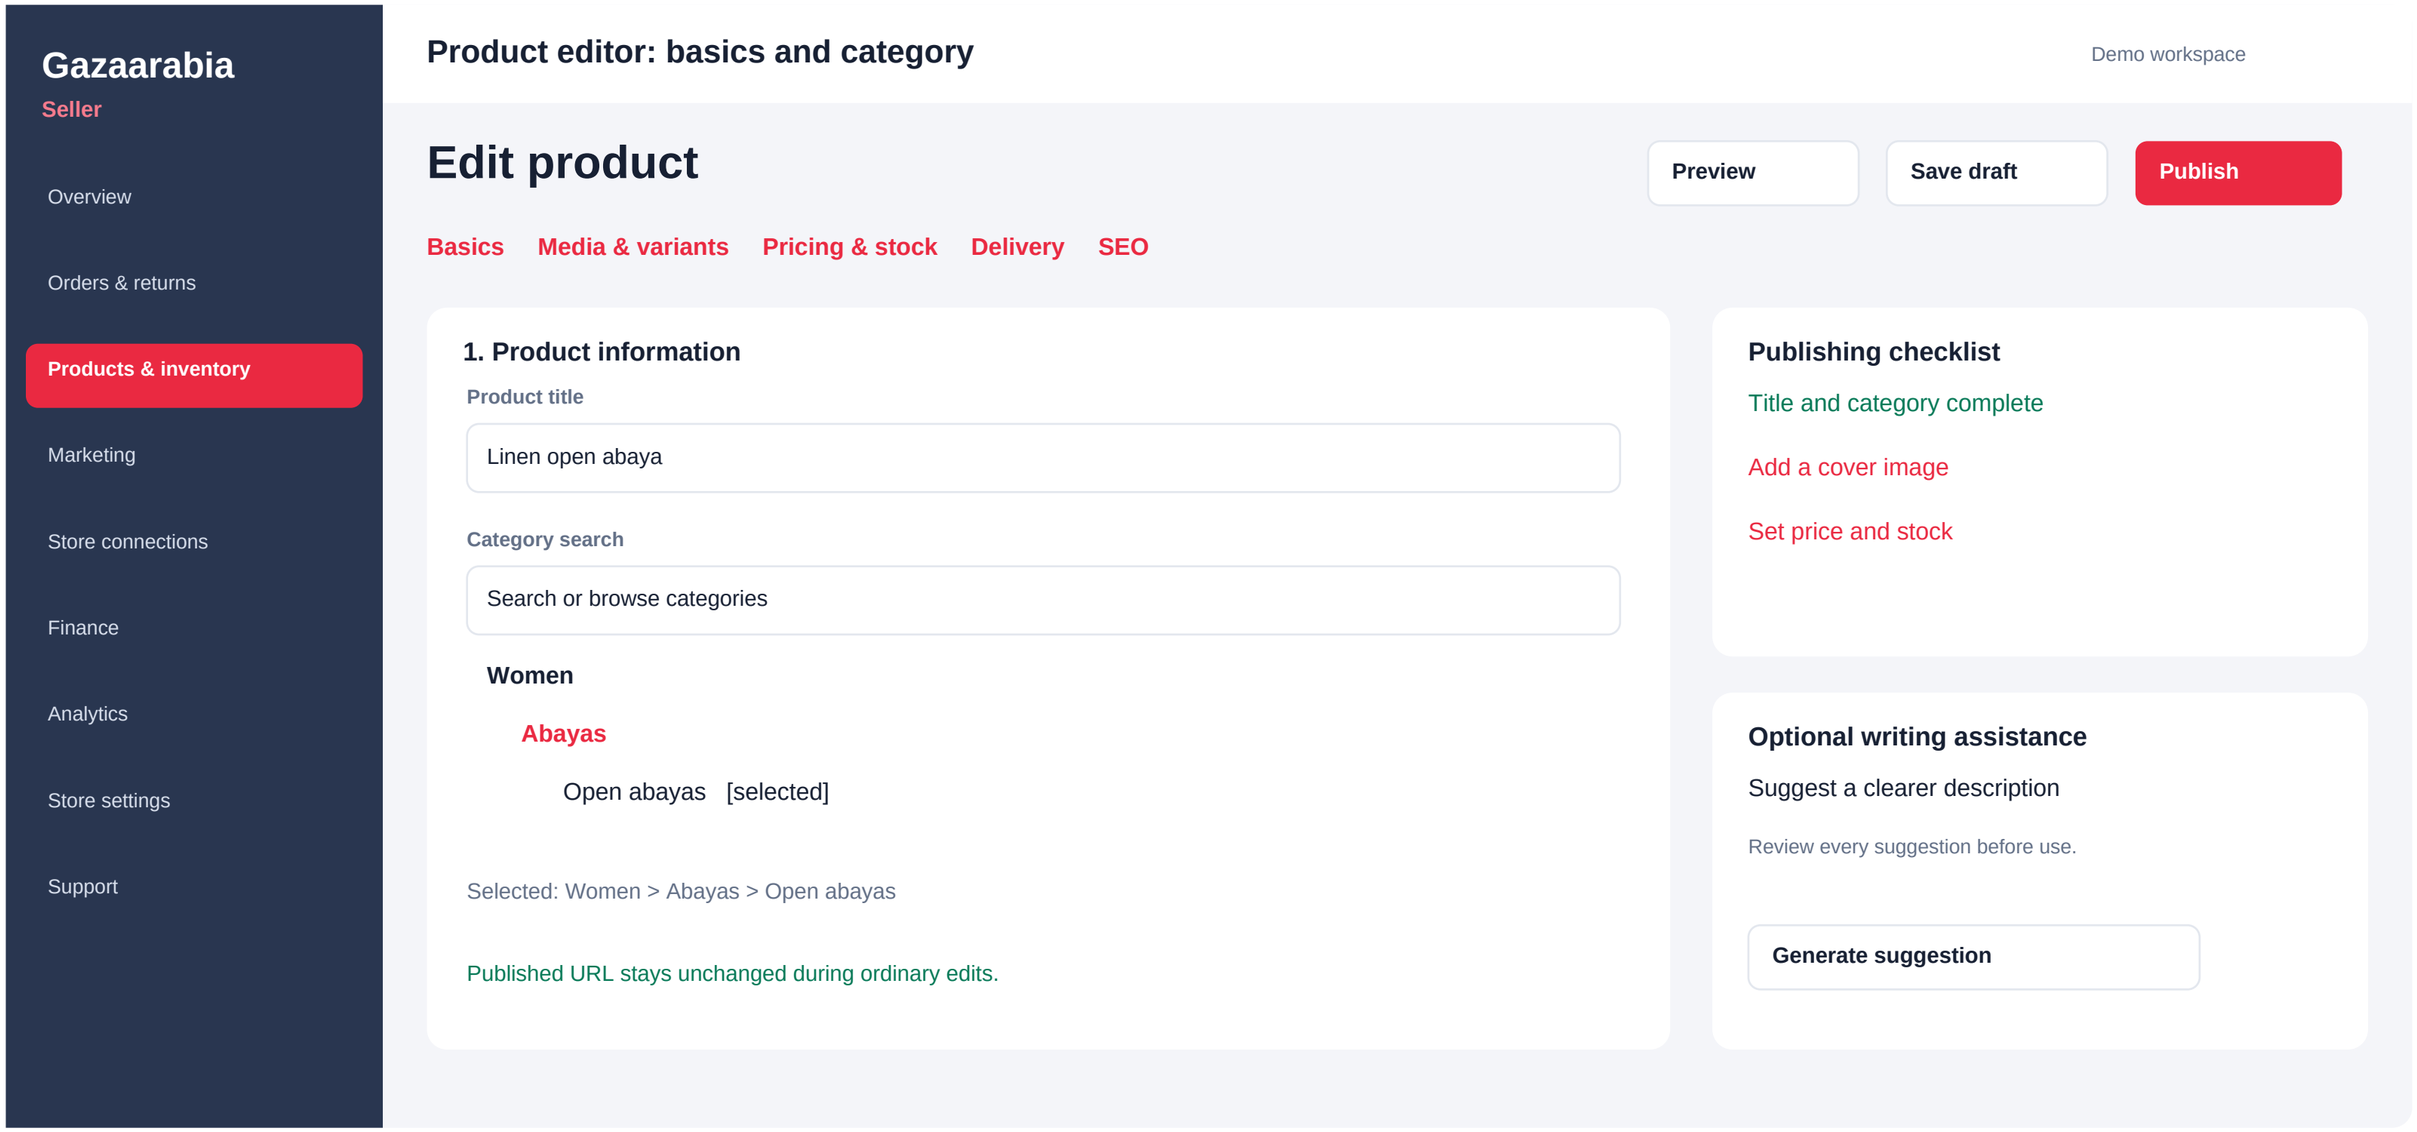

Use with checklist section 2. Example layout and demo values; adapt existing working components.

1. Separate Live, Draft, Needs attention and Archived.
2. Keep search/filter state and preview bulk changes.
3. Show imported source and stock freshness.

S03 / Product editor and categories

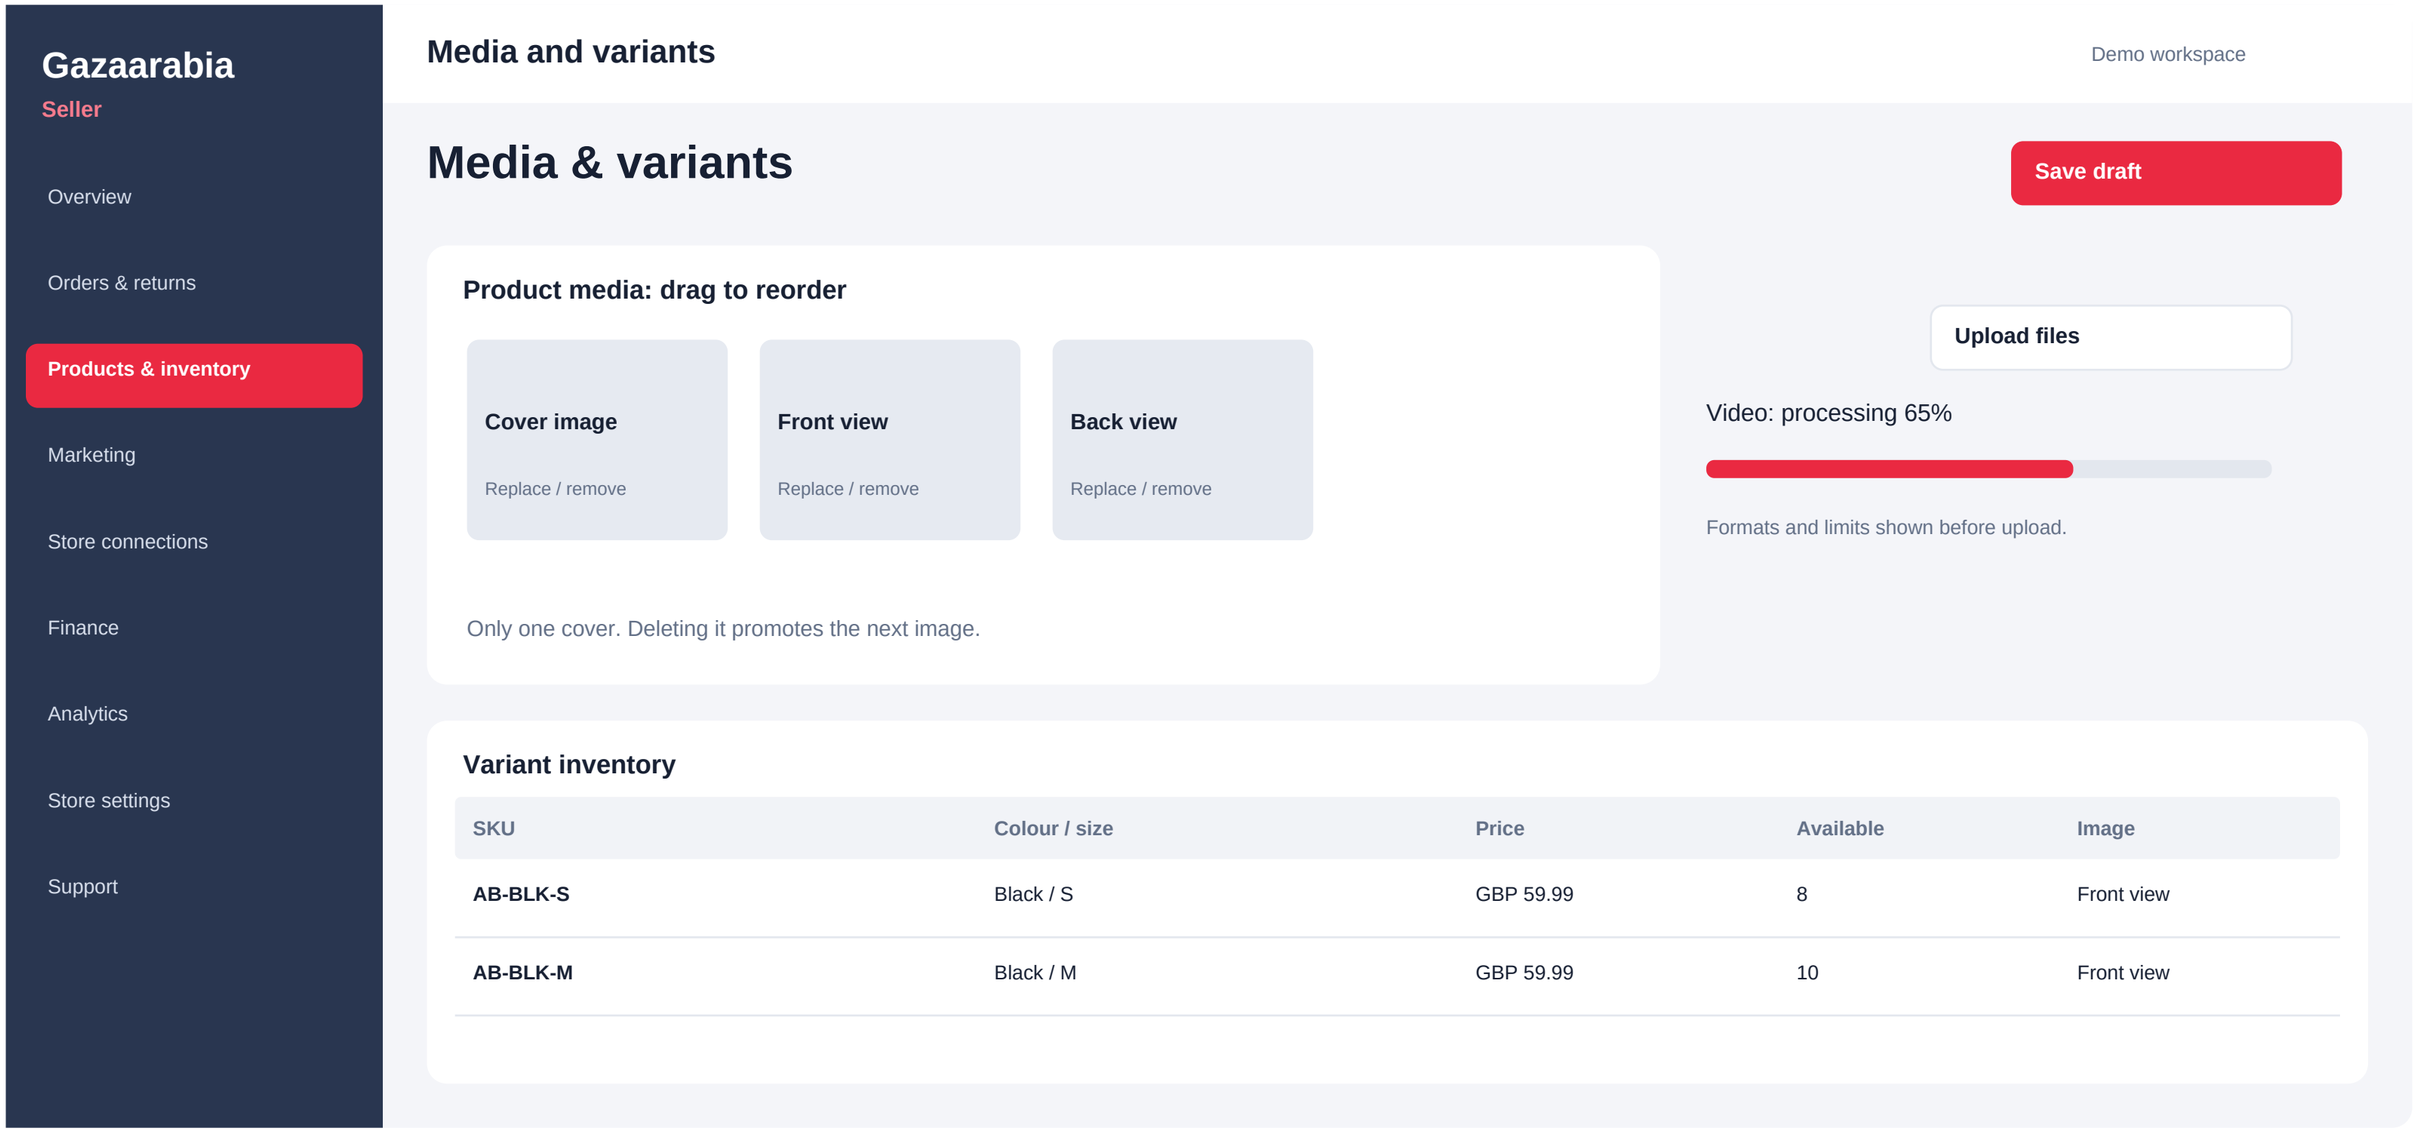

Use with checklist section 2. Example layout and demo values; adapt existing working components.

1. Keep Preview, Save Draft and Publish together.
2. Use ordered searchable categories with a clear parent path.
3. Link publishing errors to the fields that need correction.

S04 / Product images and variants

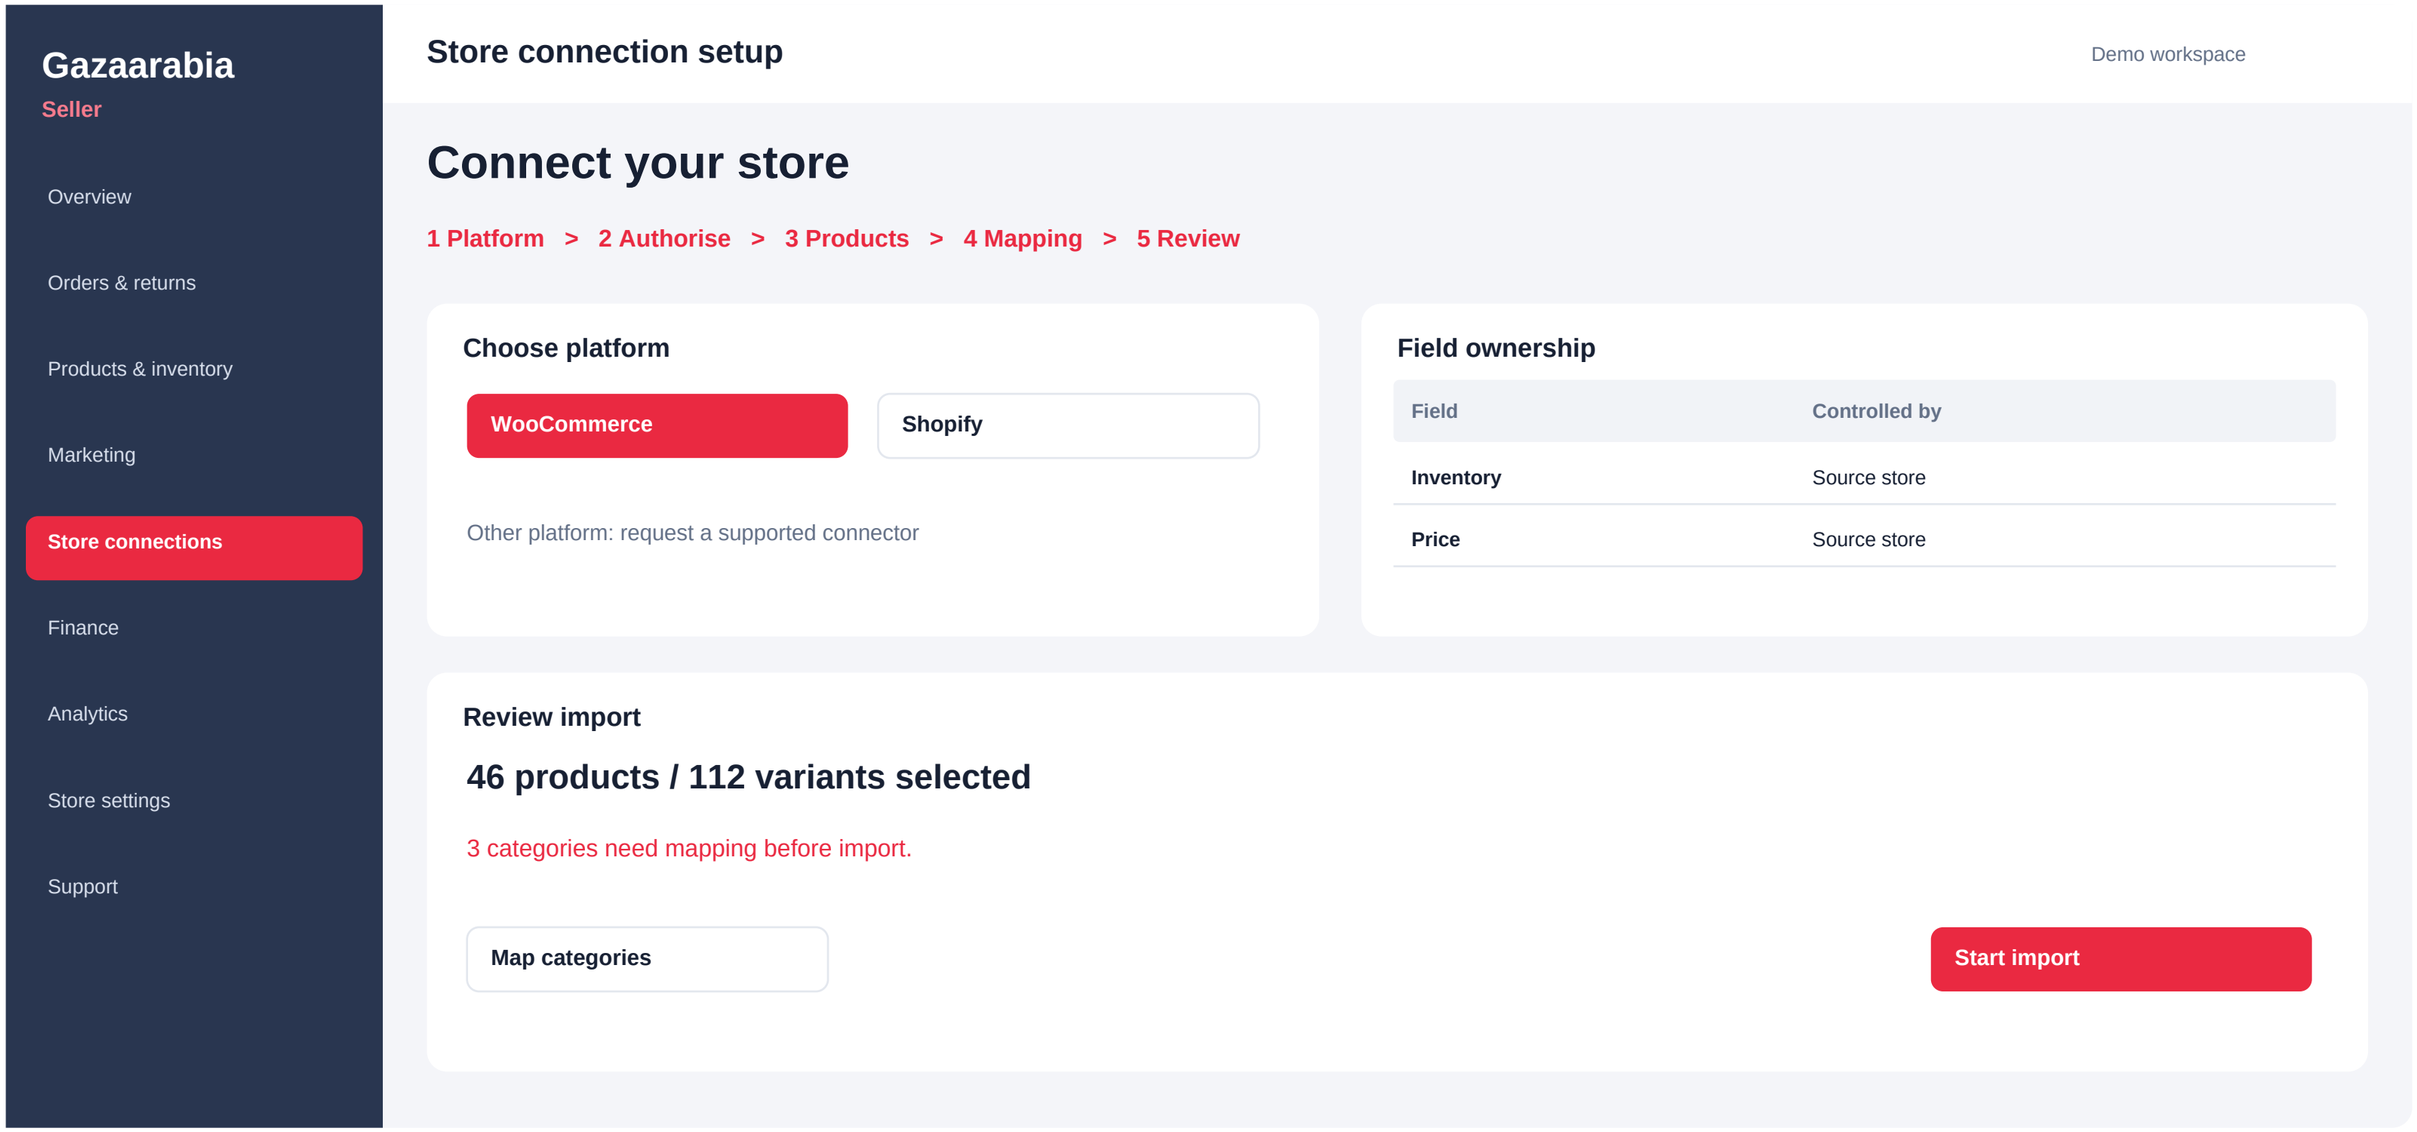

Use with checklist section 2. Example layout and demo values; adapt existing working components.

1. Allow reordering and exactly one cover image.
2. Show upload/processing progress and useful retry errors.
3. Link each variant to the correct image, SKU, price and stock.

S05 / Connect an existing store

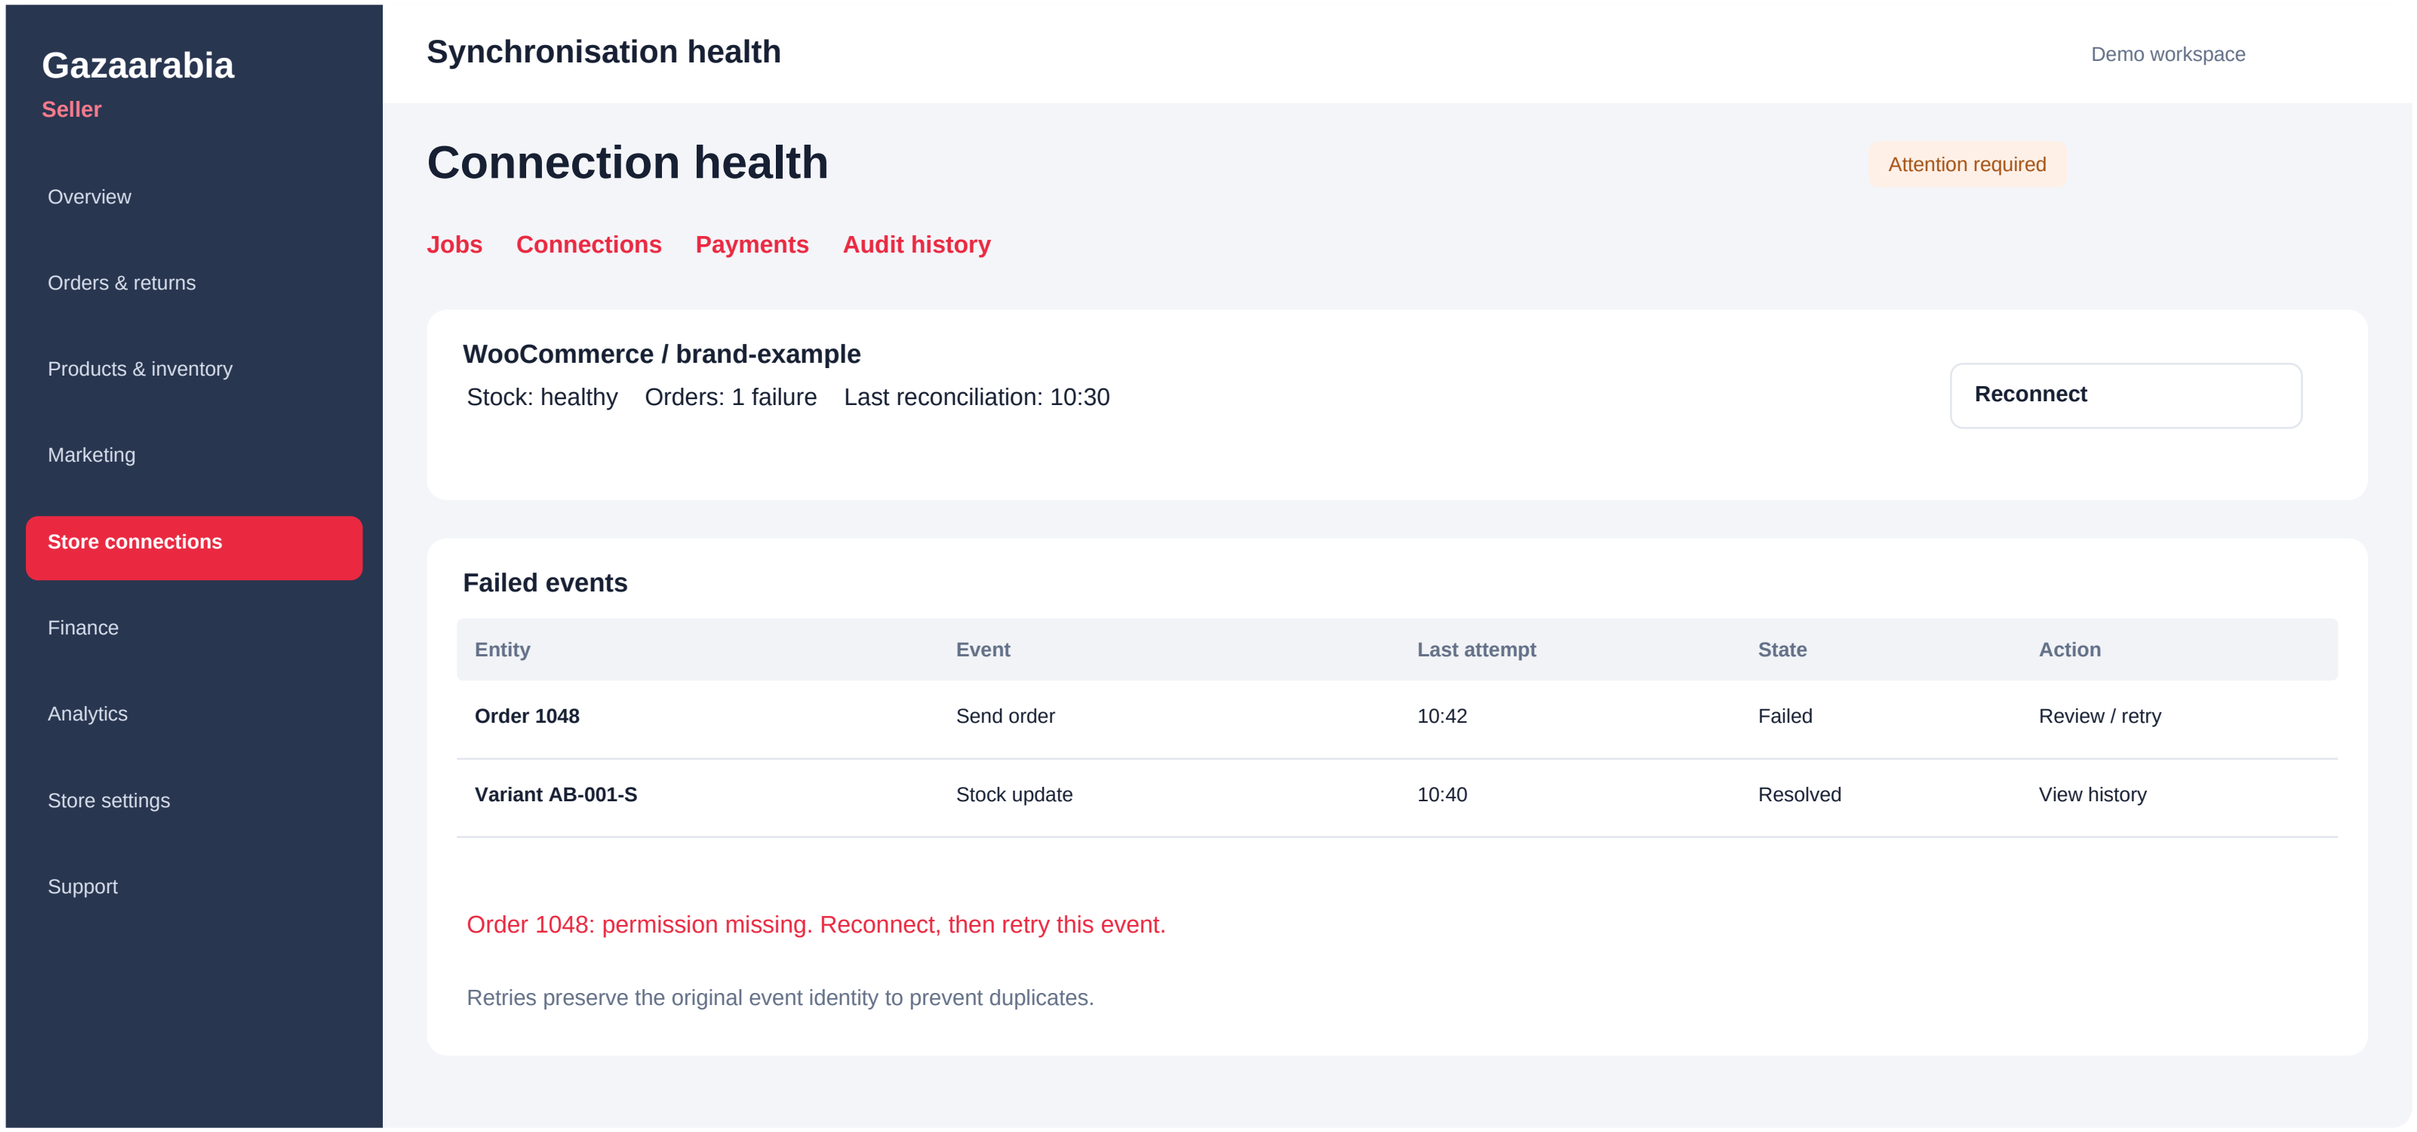

Use with checklist section 3. Example layout and demo values; adapt existing working components.

1. Guide platform choice, authorisation, products and mappings.
2. Show which website controls each product field.
3. Review imports before making products public.

S06 / Connection status and retries

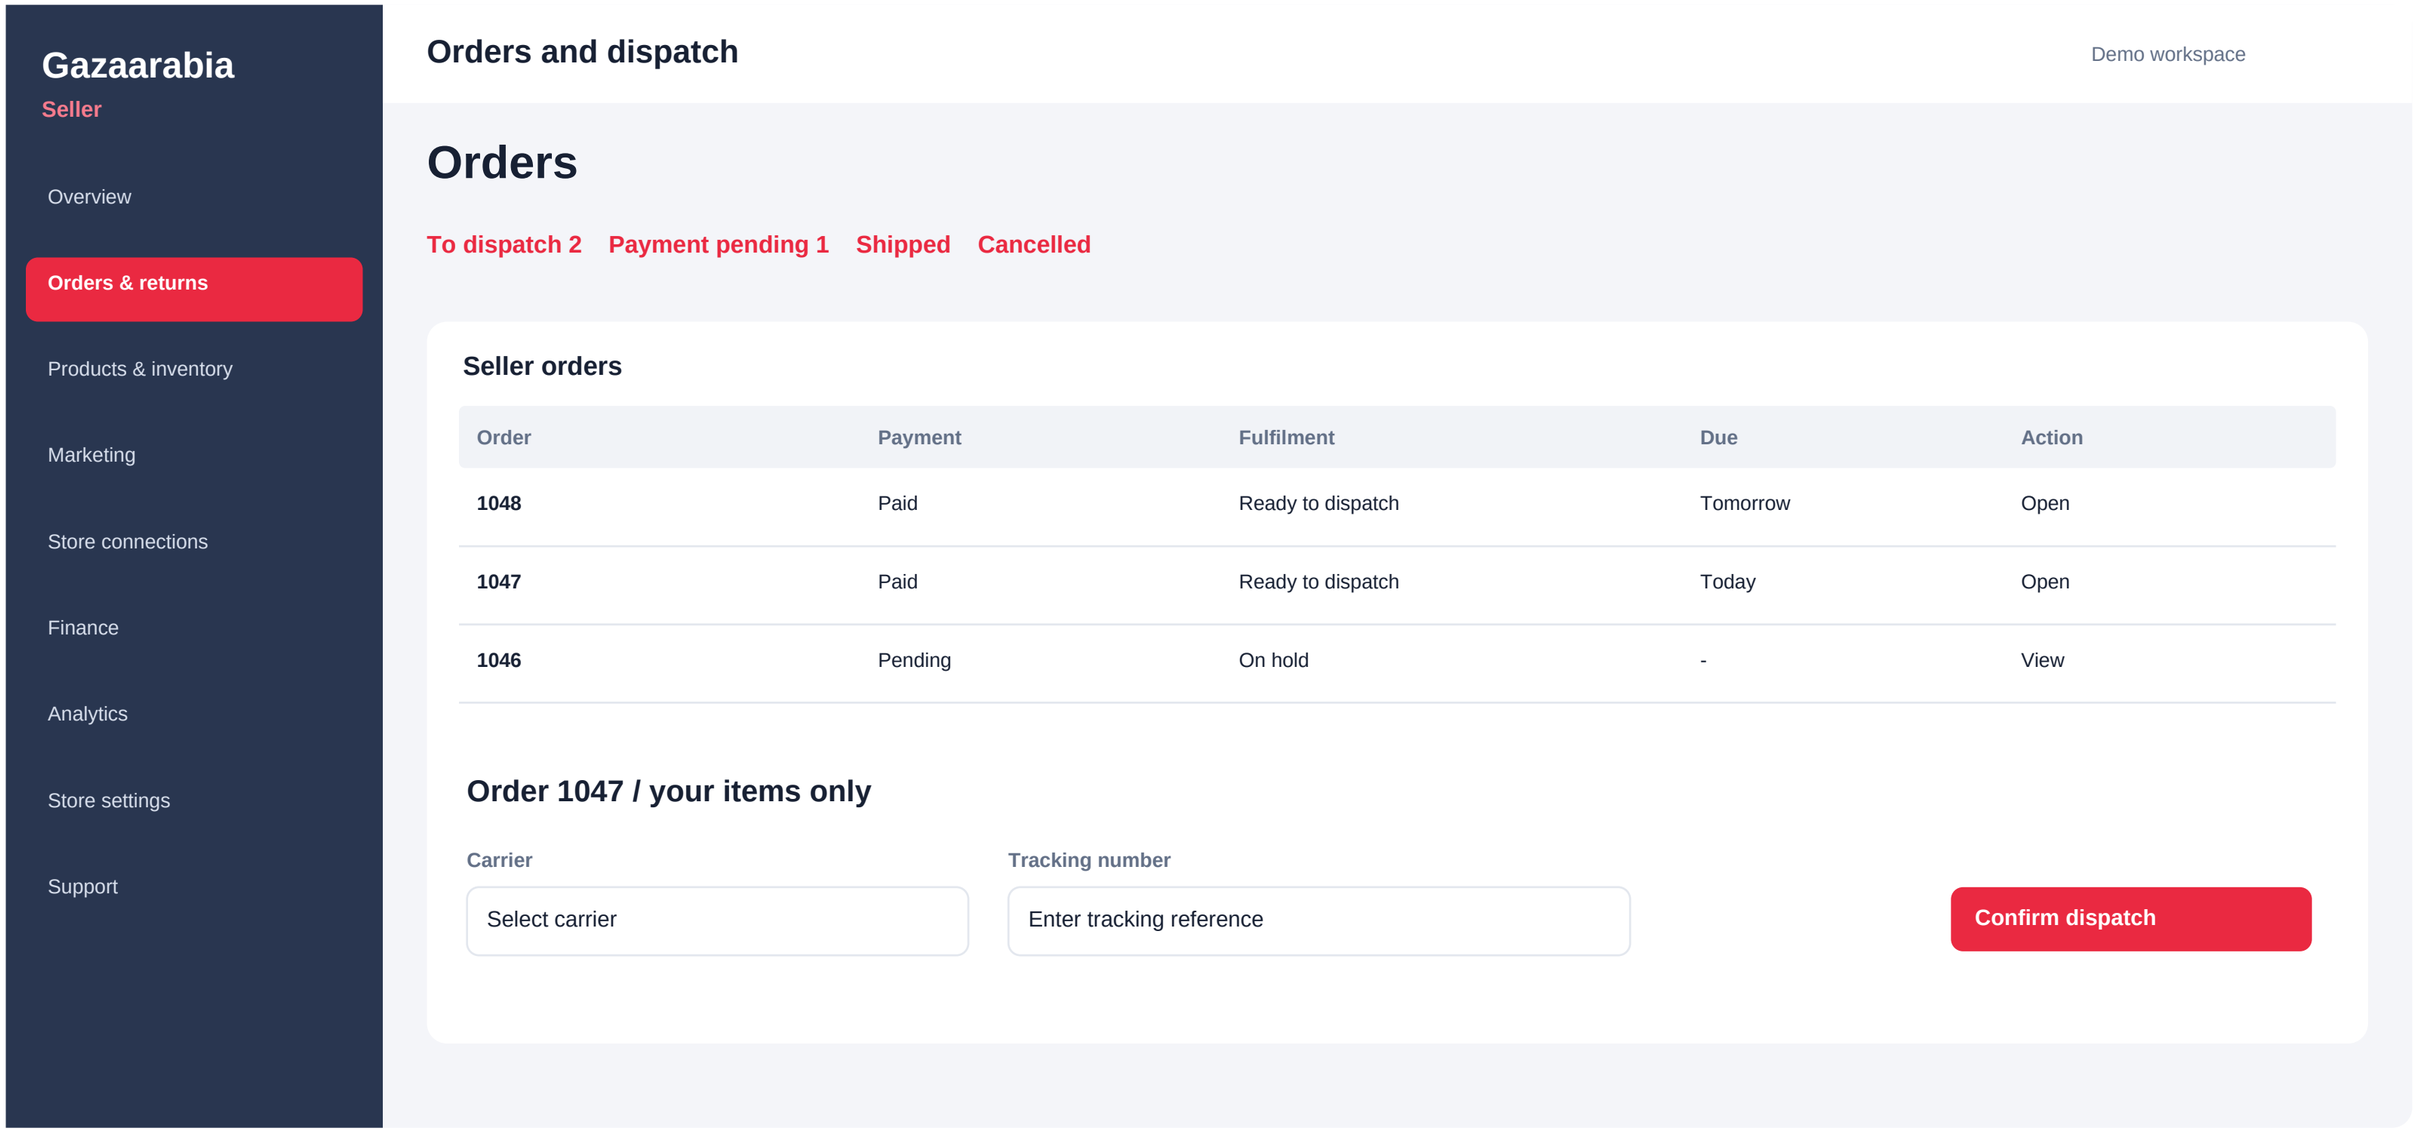

Use with checklist section 3. Example layout and demo values; adapt existing working components.

1. Separate stock, product and order health.
2. Show affected records, last success and the next action.
3. Retry safely and display the actual result.

S07 / Orders and dispatch

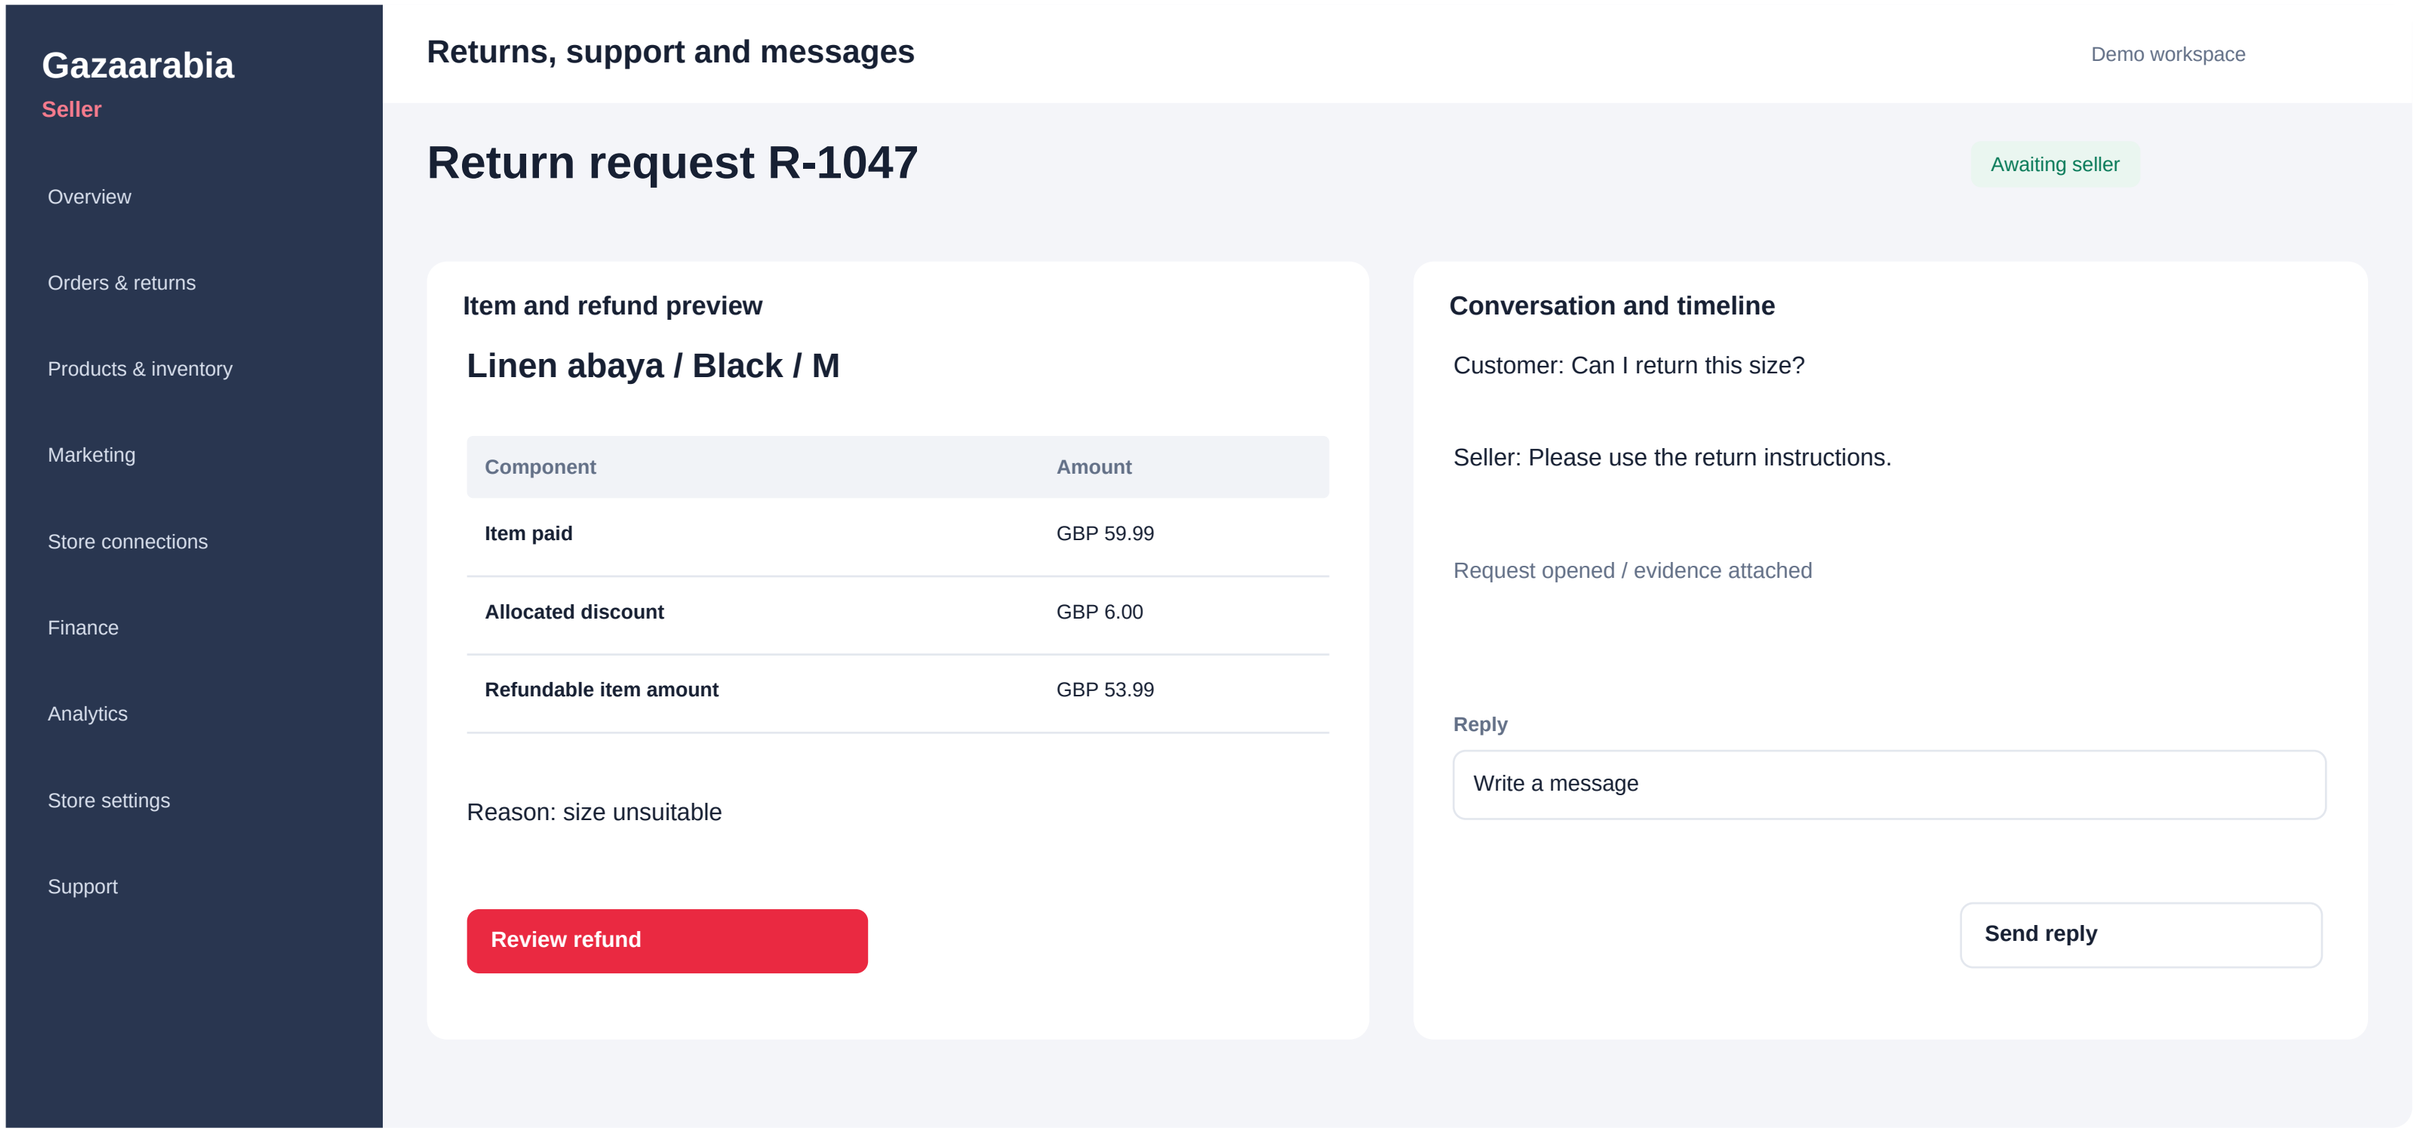

Use with checklist section 4. Example layout and demo values; adapt existing working components.

1. Separate payment status from dispatch status.
2. Show only this seller orders and support partial parcels.
3. Require the correct tracking information before dispatch.

S08 / Returns and customer messages

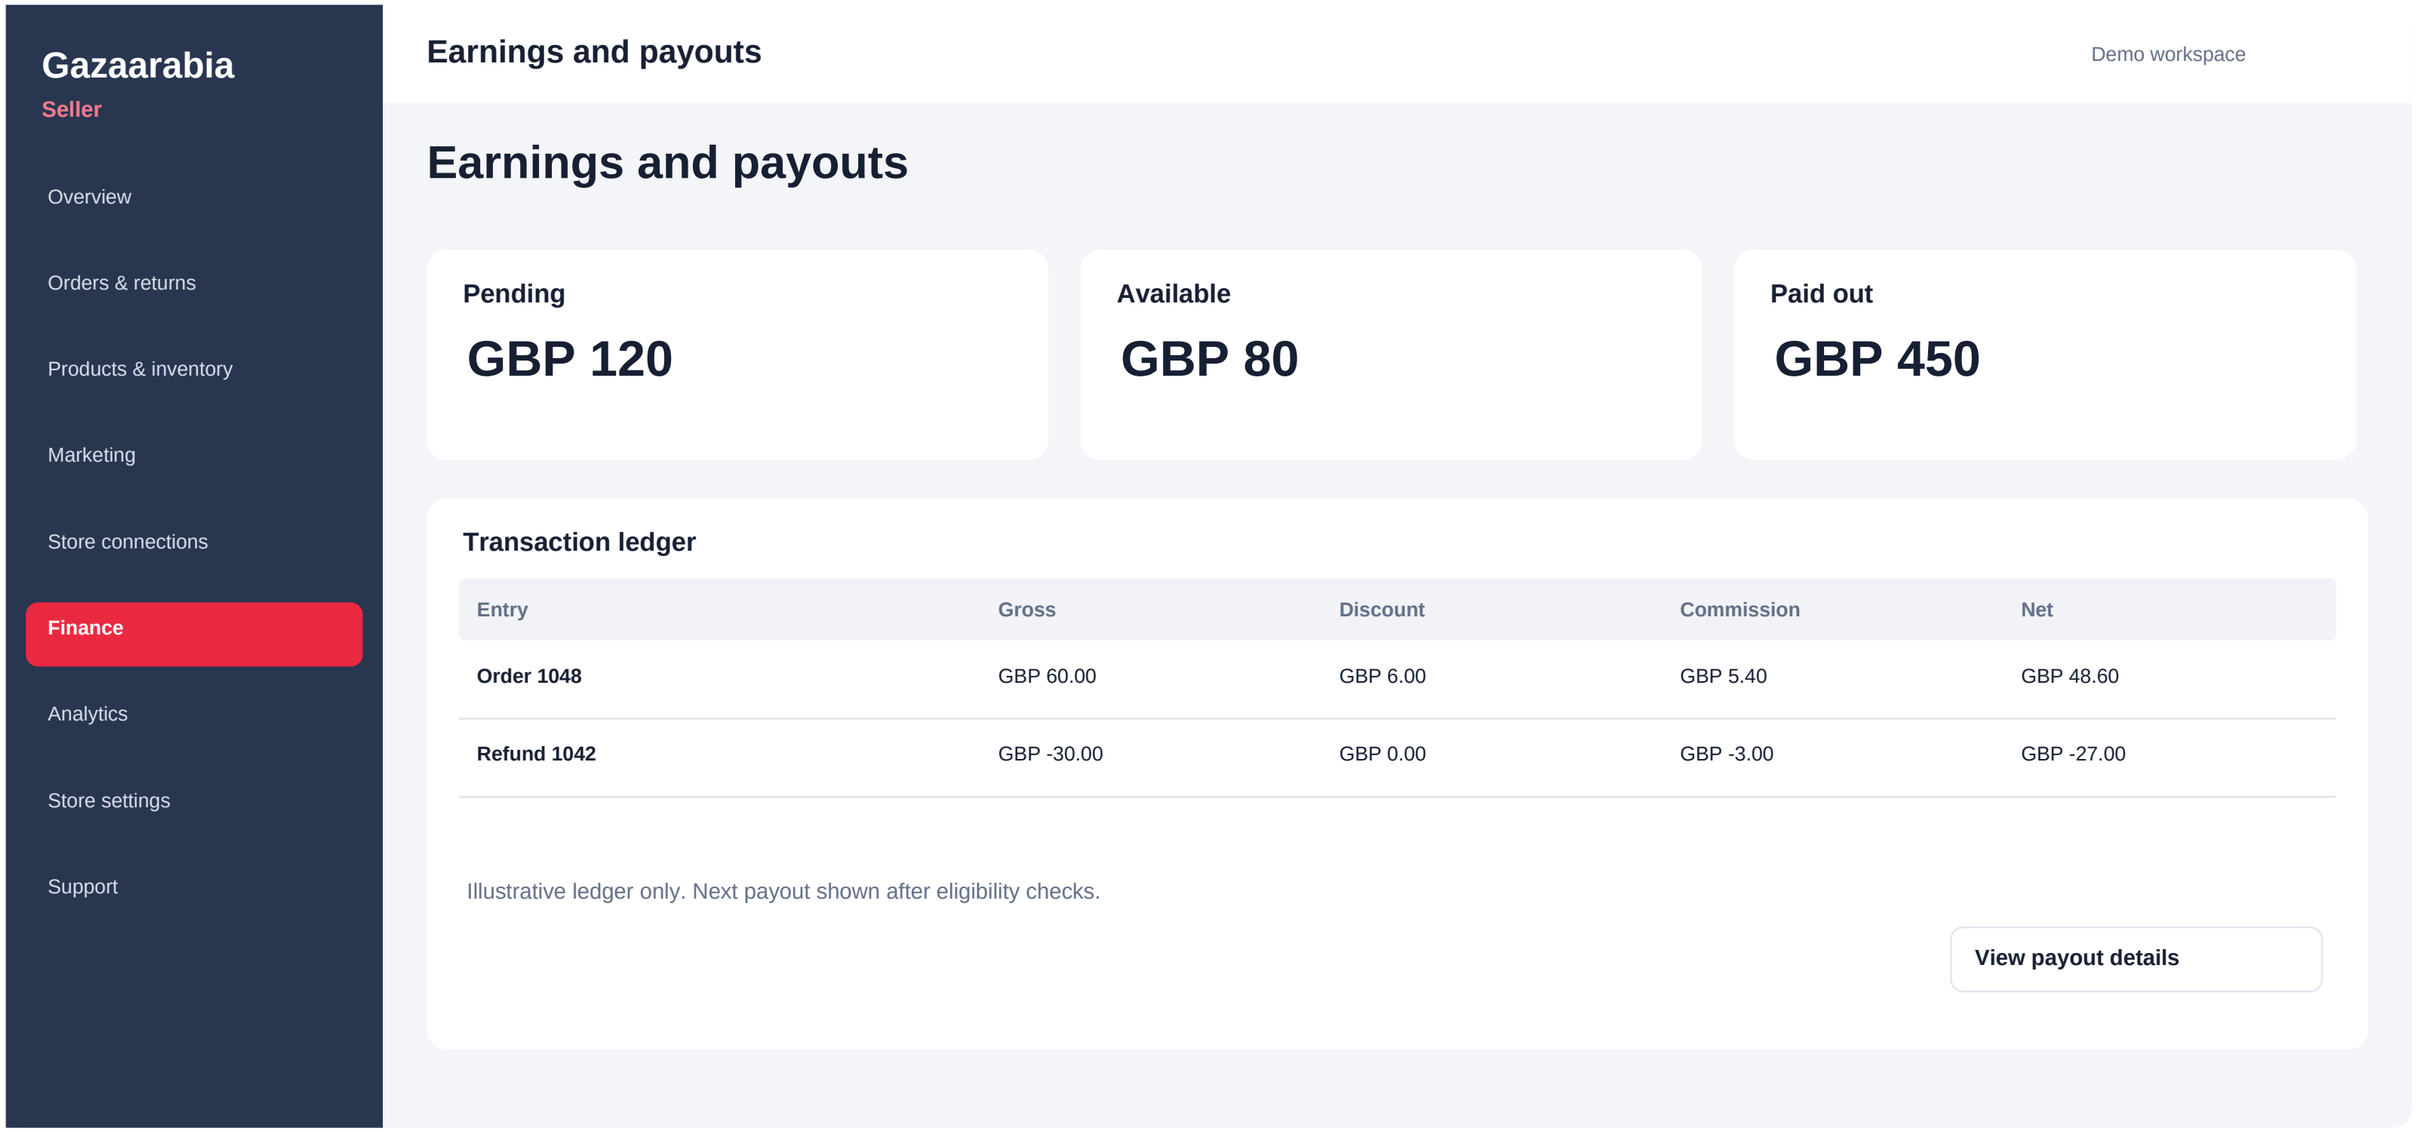

Use with checklist section 4. Example layout and demo values; adapt existing working components.

1. Keep item, reason, conversation and timeline together.
2. Preview the original eligible refund before confirming.
3. Show processing/failure states and prevent repeat refunds.

S09 / Seller earnings

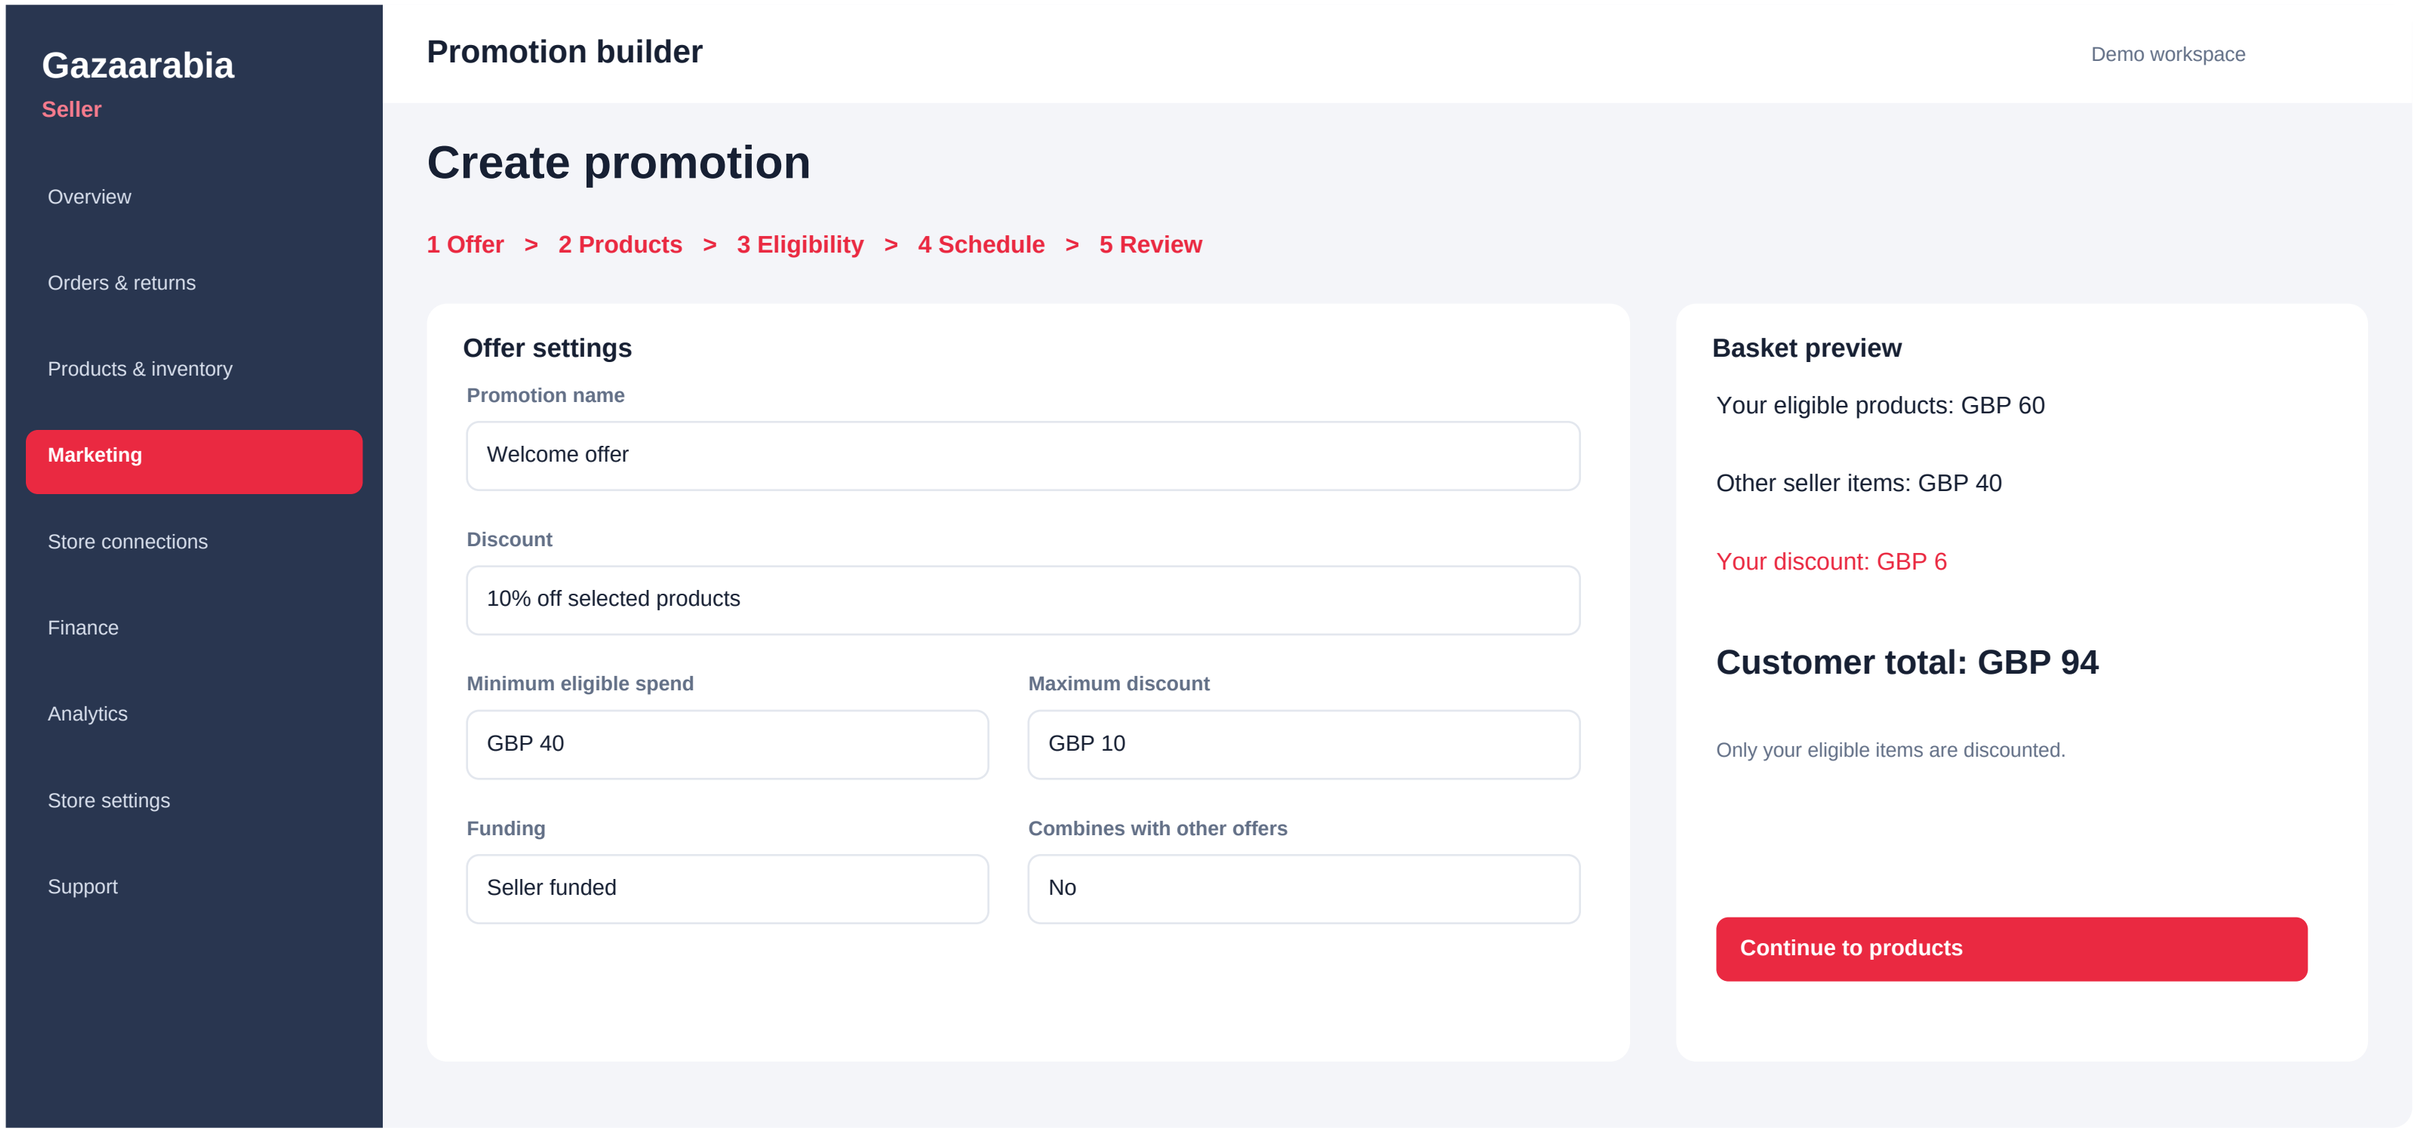

Use with checklist section 4. Example layout and demo values; adapt existing working components.

1. Separate pending, available and paid-out money.
2. Link deductions to order and ledger details.
3. Explain holds and payout eligibility.

S10 / Seller promotion builder

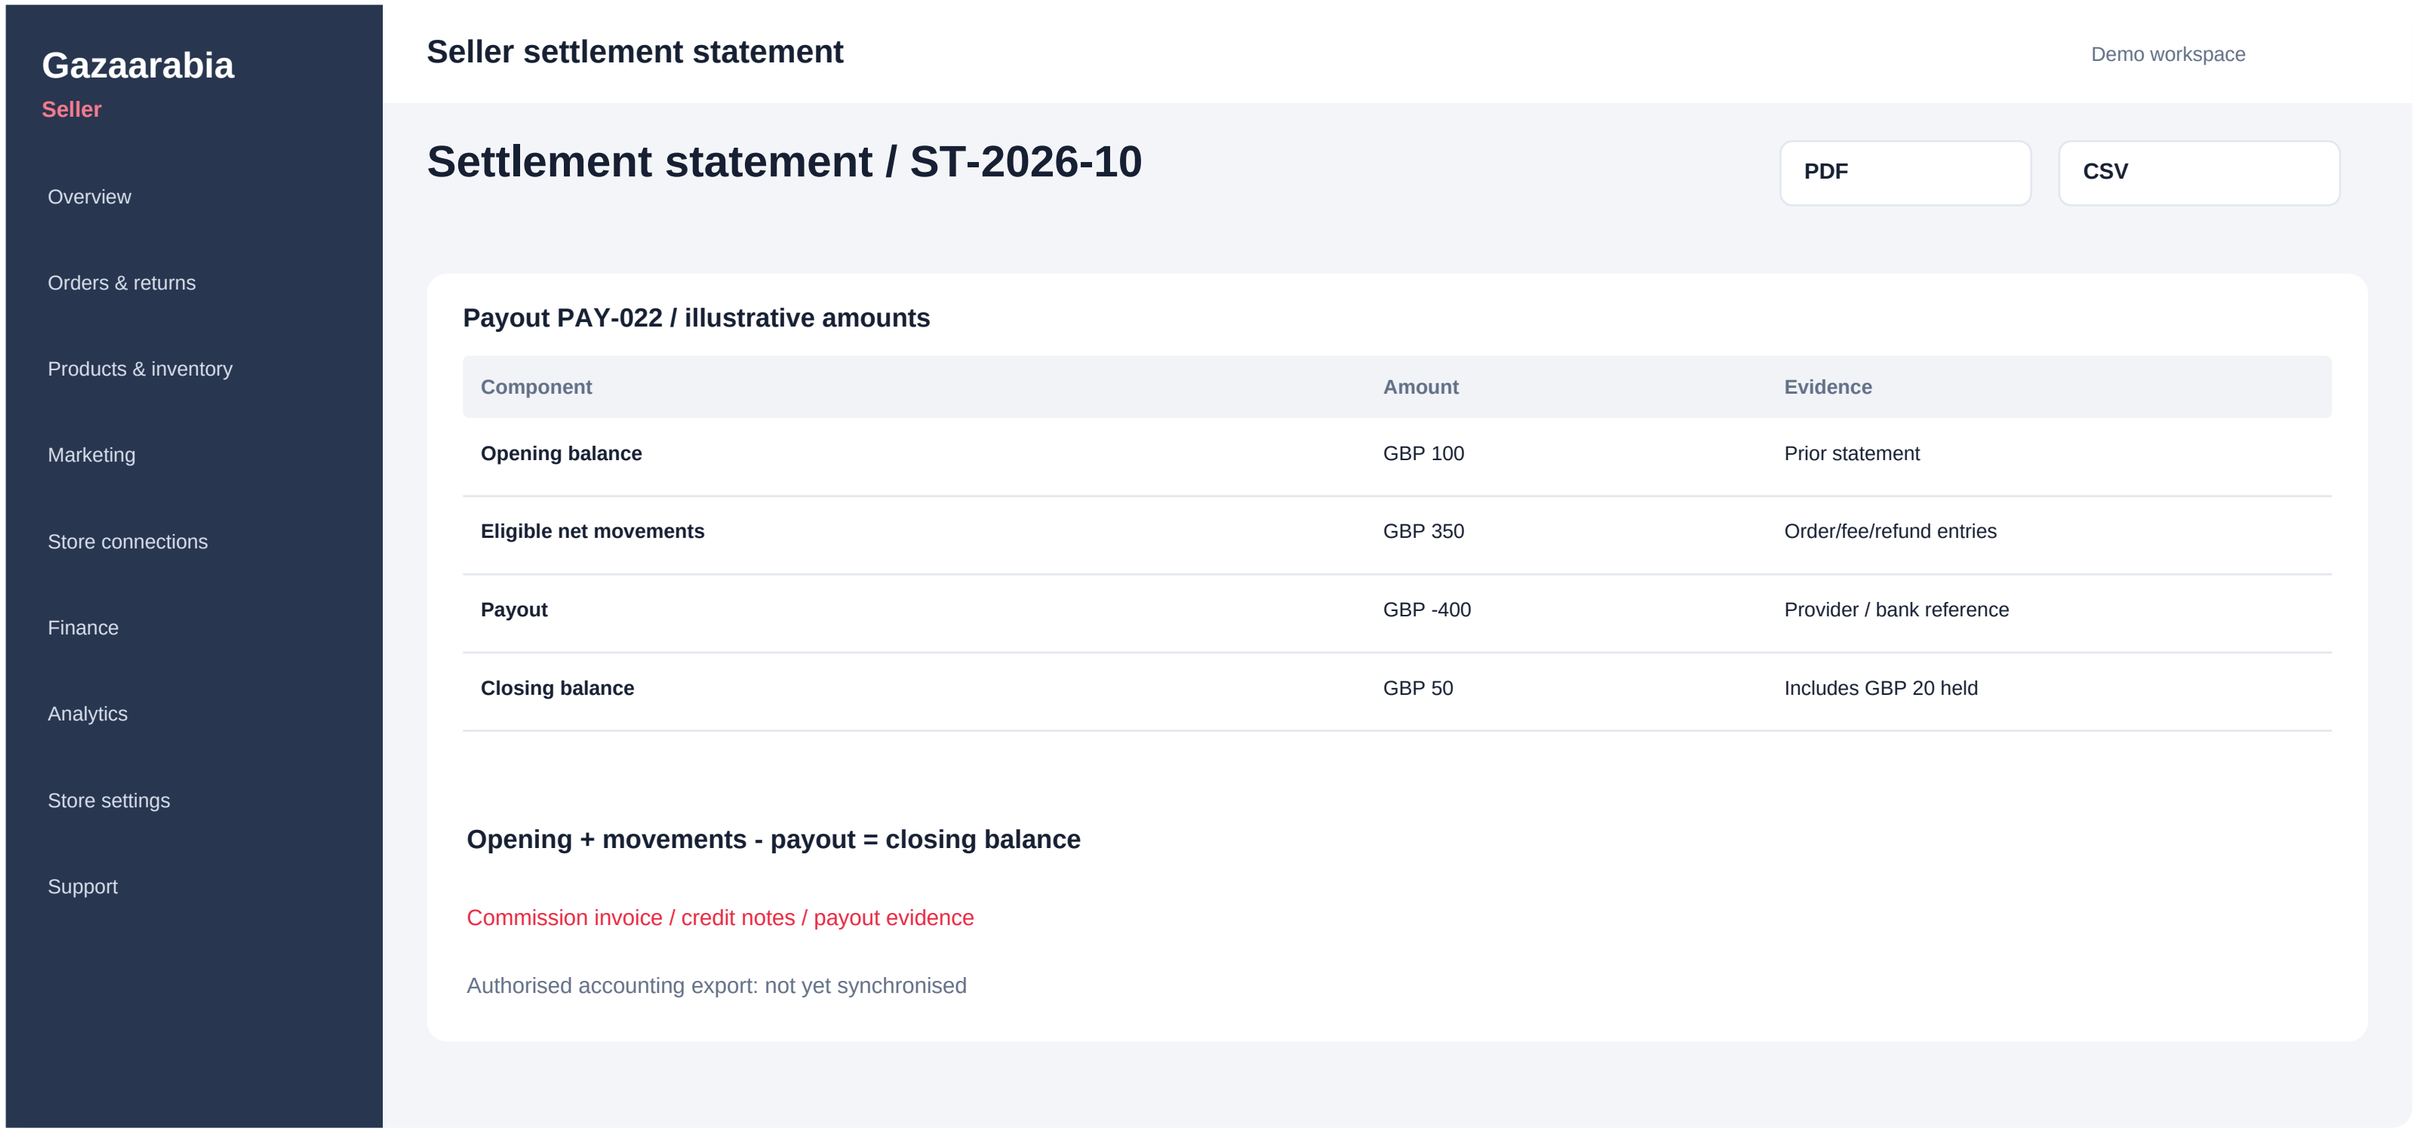

Use with checklist section 6. Example layout and demo values; adapt existing working components.

1. Use short steps: offer, products, eligibility, dates and review.
2. Show who funds the discount and allowed combinations.
3. Preview buyer total and seller cost before activation.

S14 / Seller settlement statement

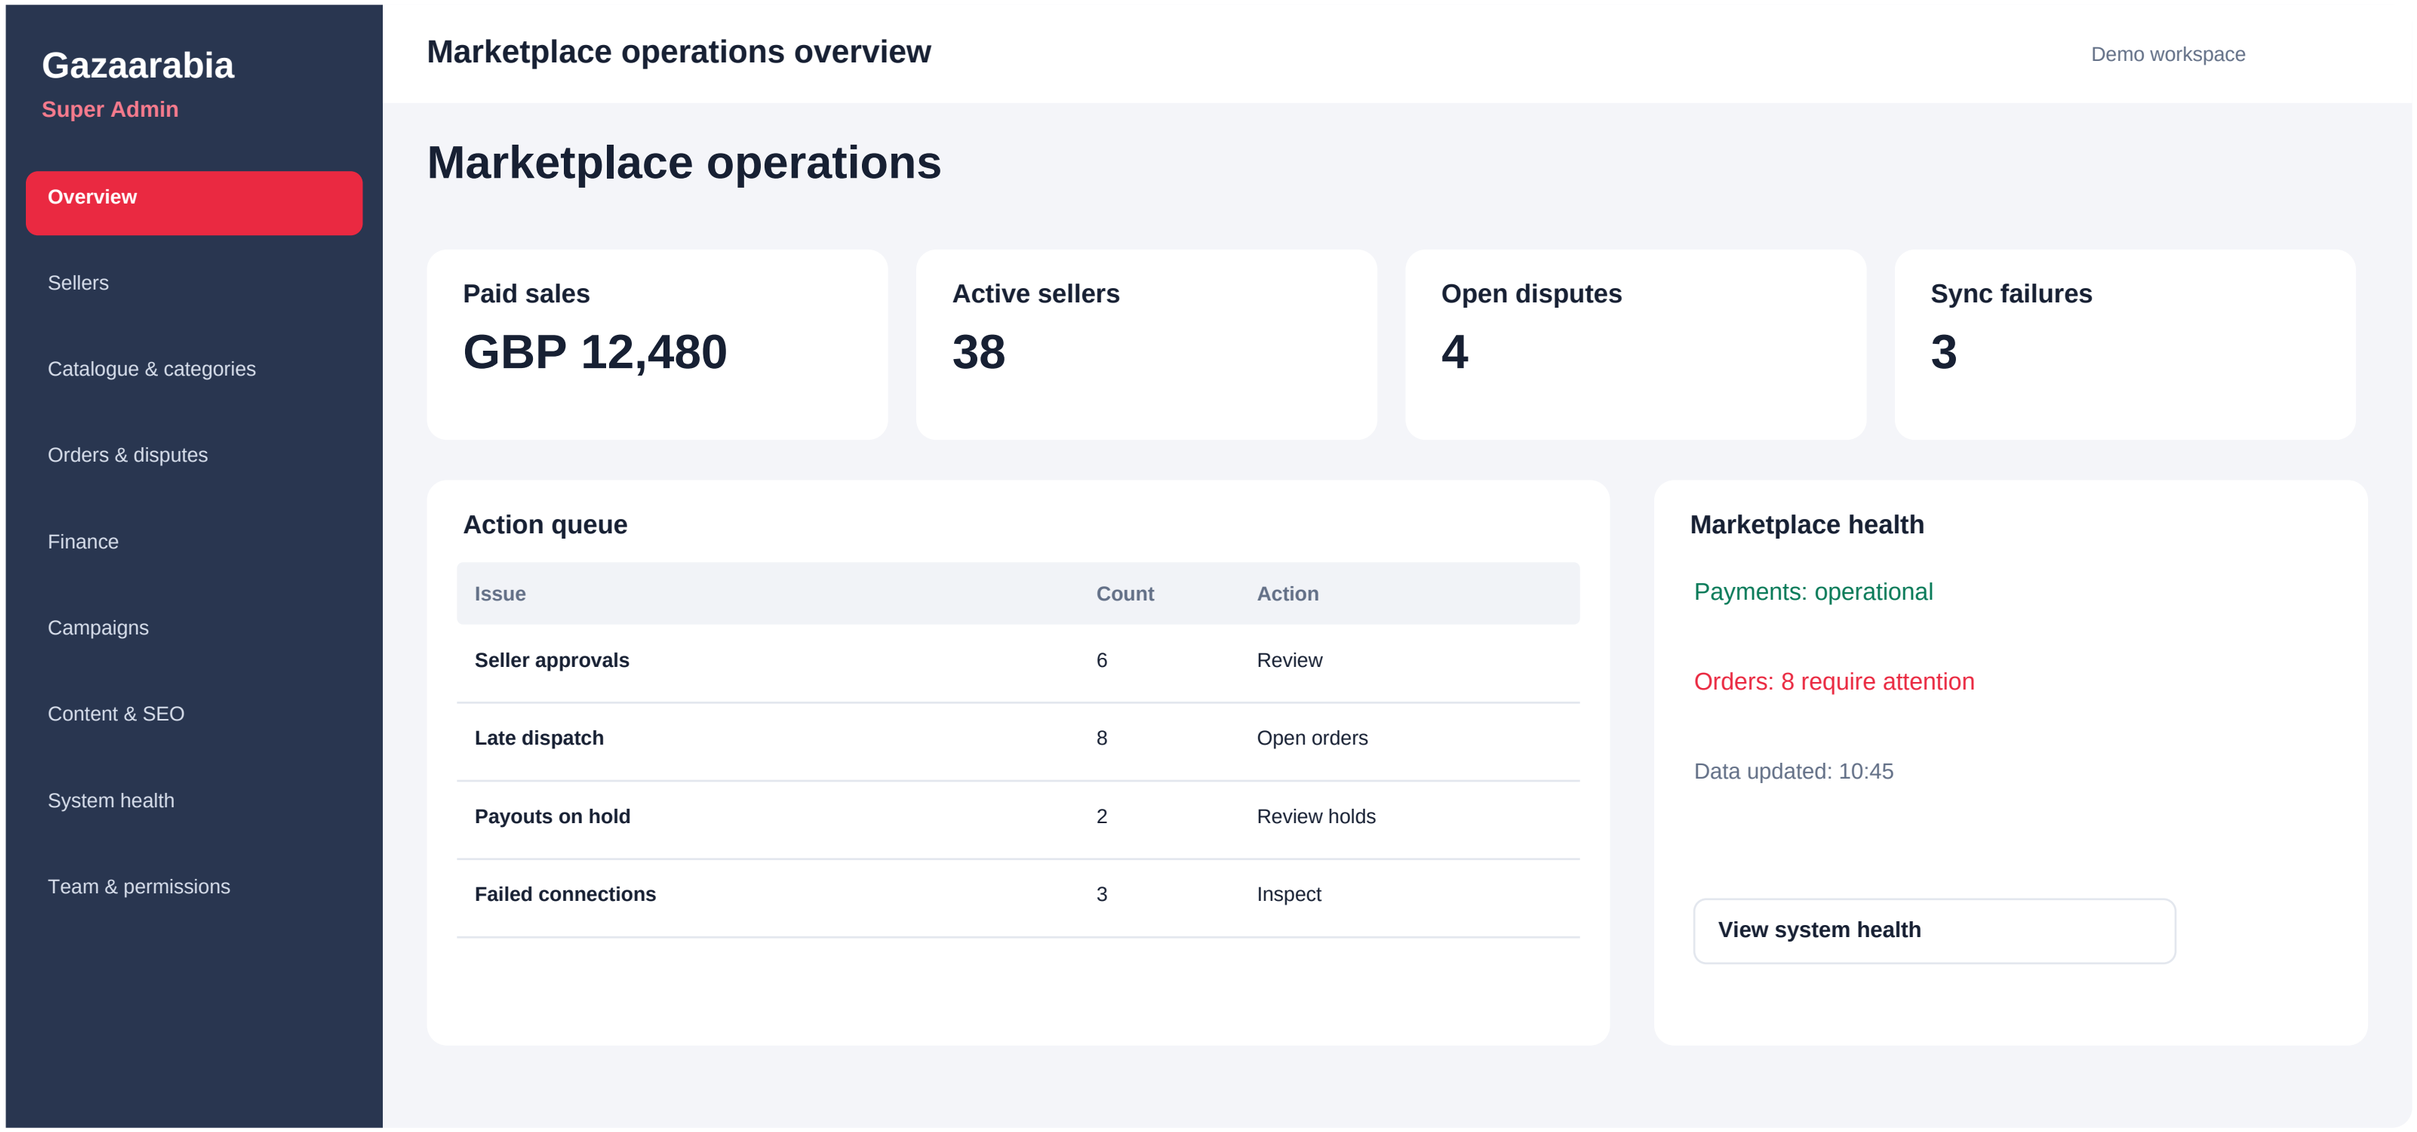

Use with checklist section 4. Example layout and demo values; adapt existing working components.

1. Explain opening balance, movements, payout and closing balance.
2. Link the actual orders, fees, refunds and documents.
3. Download PDF/CSV without exposing another seller records.

A01 / Super Admin overview

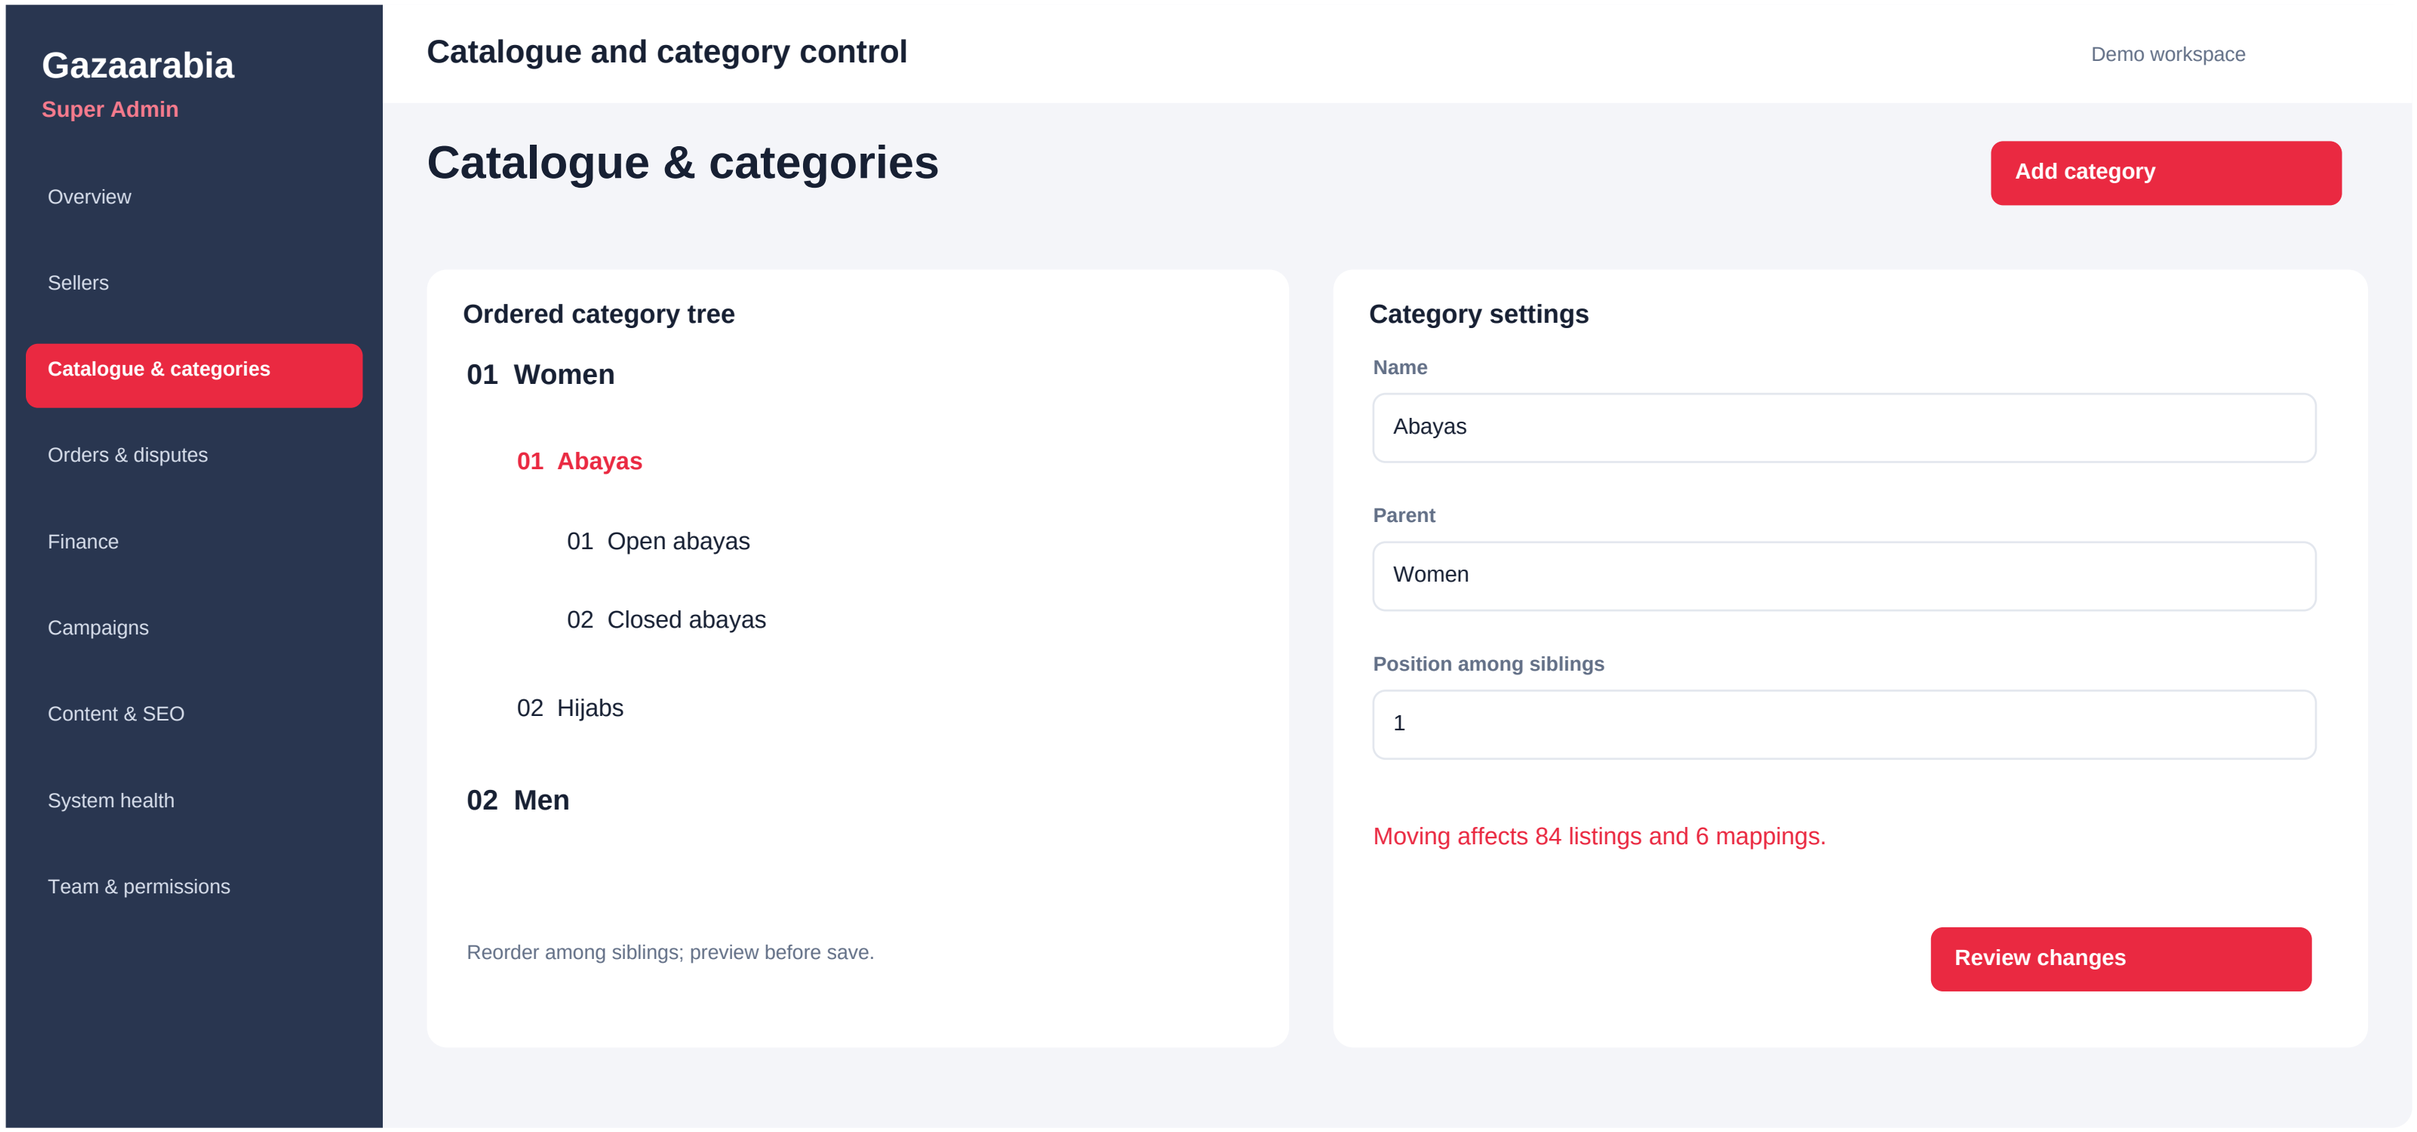

Use with checklist section 5. Example layout and demo values; adapt existing working components.

1. Put unresolved operational work beside defined metrics.
2. Make each count open the matching work queue.
3. Restrict actions according to the staff role.

A03 / Admin categories and catalogue

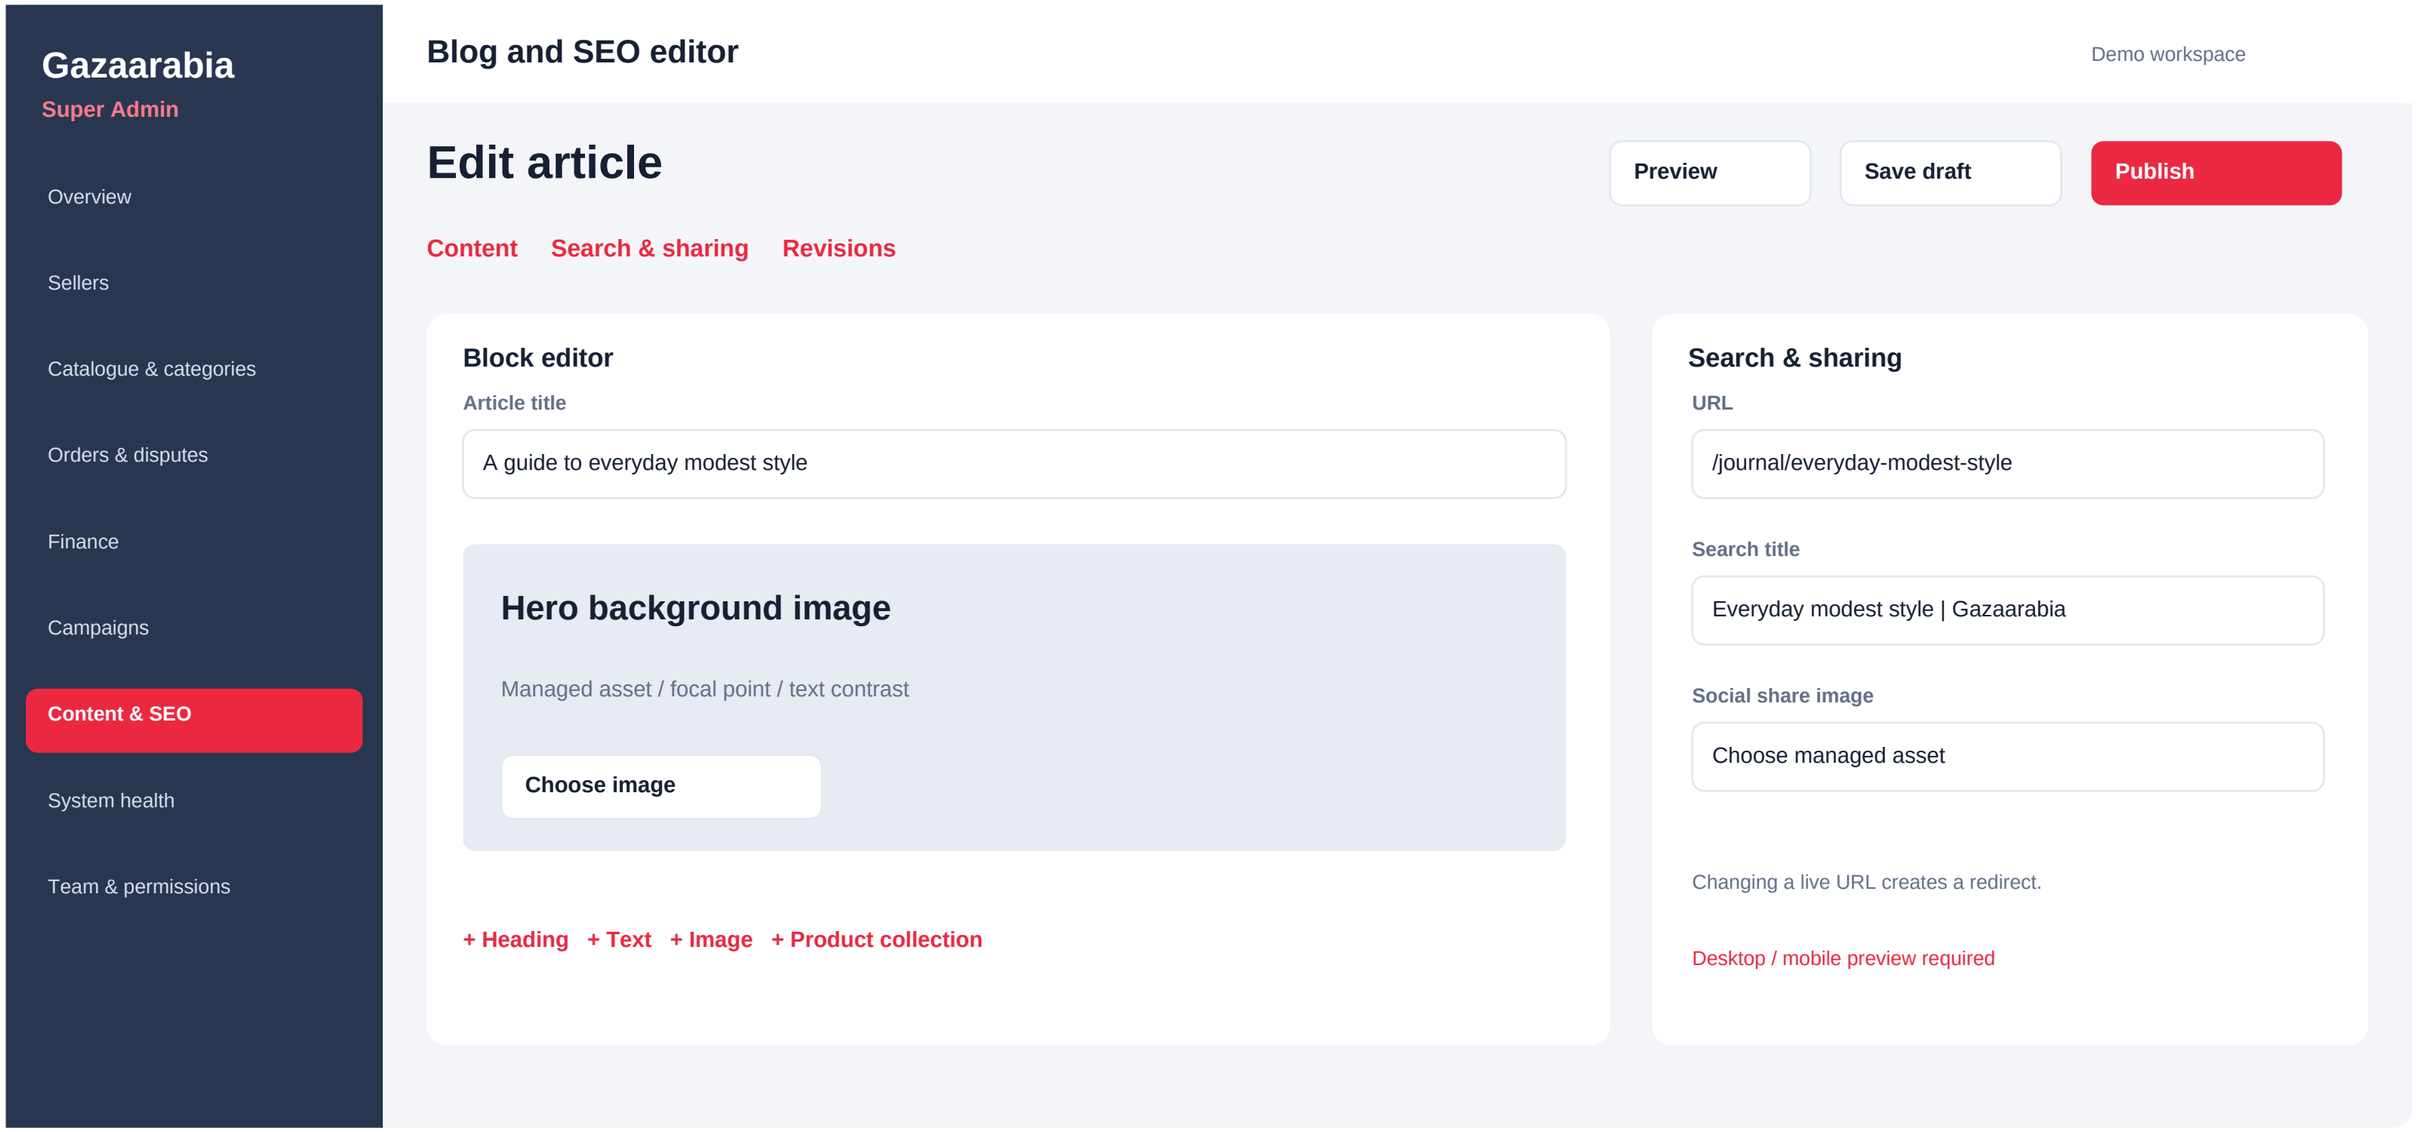

Use with checklist section 2. Example layout and demo values; adapt existing working components.

1. Keep one ordered category tree for every channel.
2. Preview the effect of moves or merges.
3. Return listing corrections with a clear reason.

A05 / Blog and SEO editor

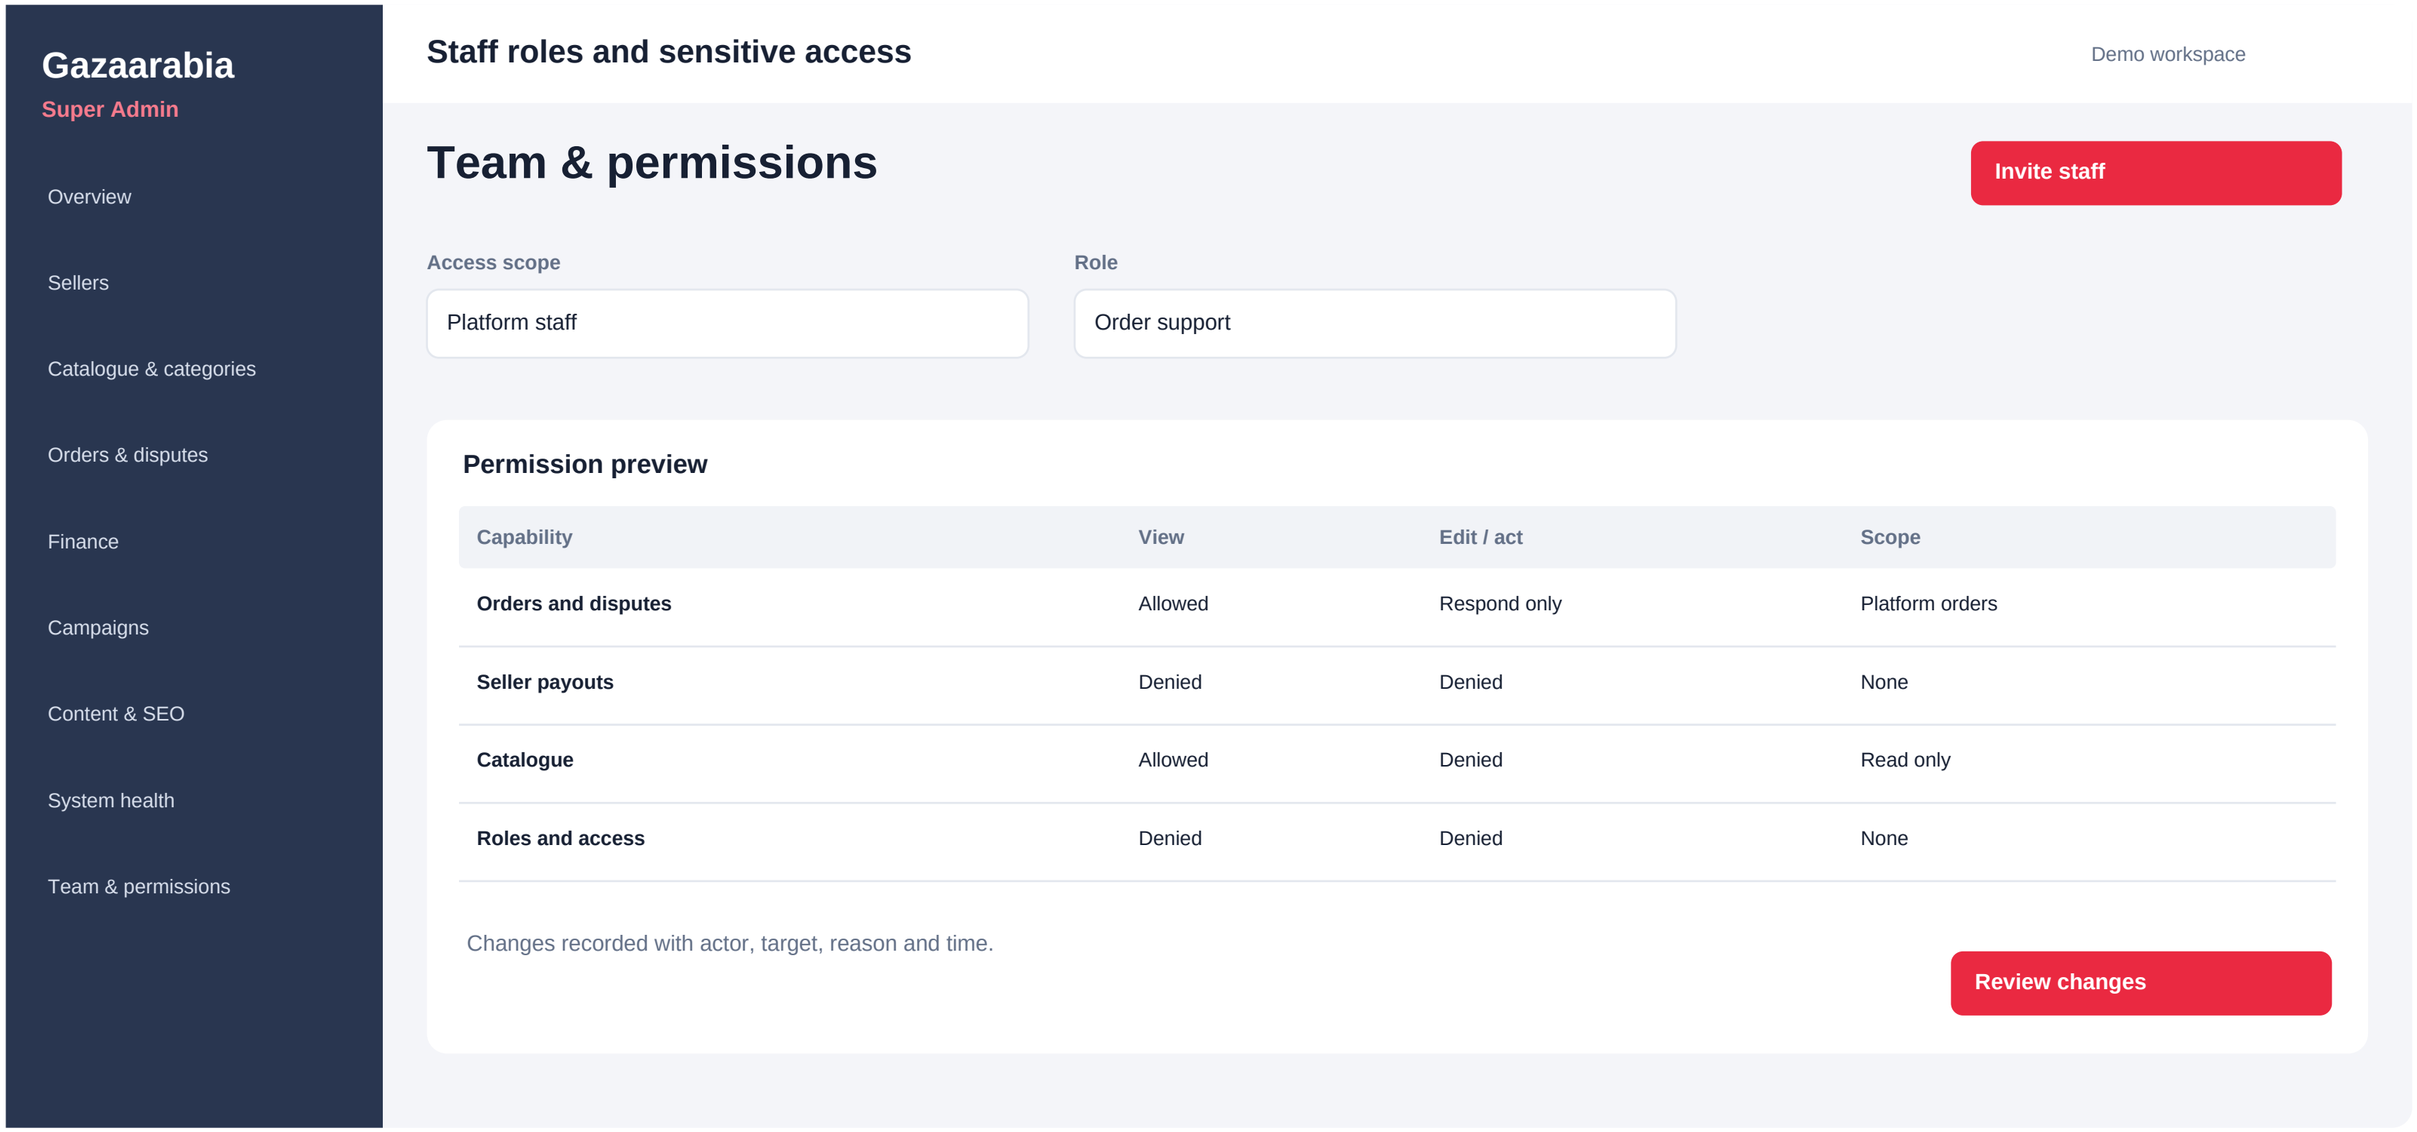

Use with checklist section 8. Example layout and demo values; adapt existing working components.

1. Use supported content blocks and managed images.
2. Preview mobile, metadata and background images before publishing.
3. Keep revisions and redirect old published URLs.

A07 / Staff roles and permissions

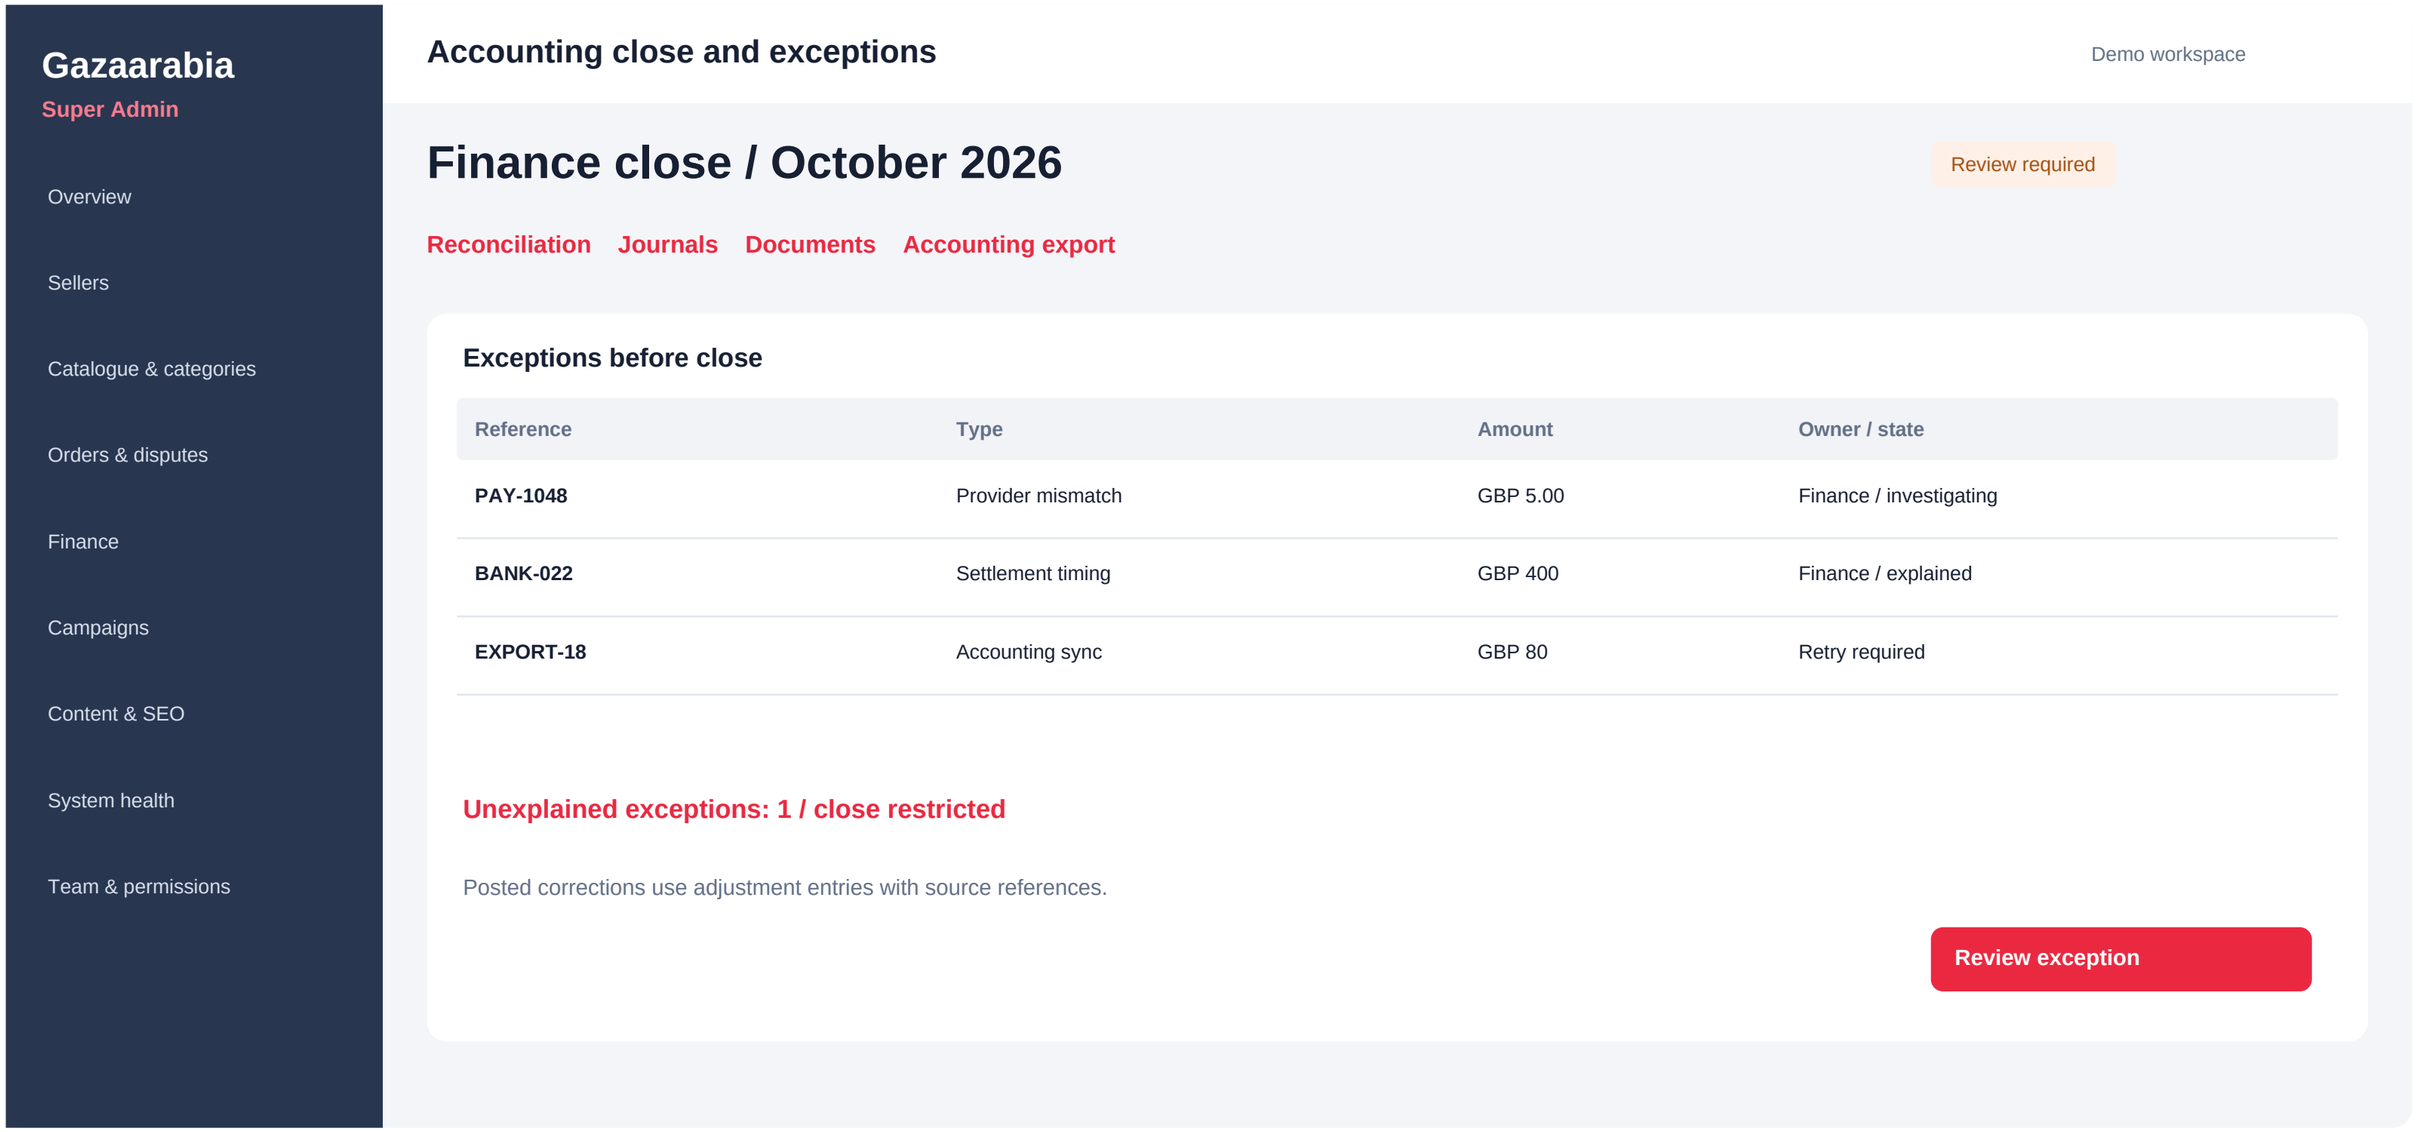

Use with checklist section 5. Example layout and demo values; adapt existing working components.

1. Separate seller-team scope from platform staff access.
2. Give each role only the actions it needs.
3. Audit permission changes and enforce the same rules in the API.

A10 / Accounting and reconciliation

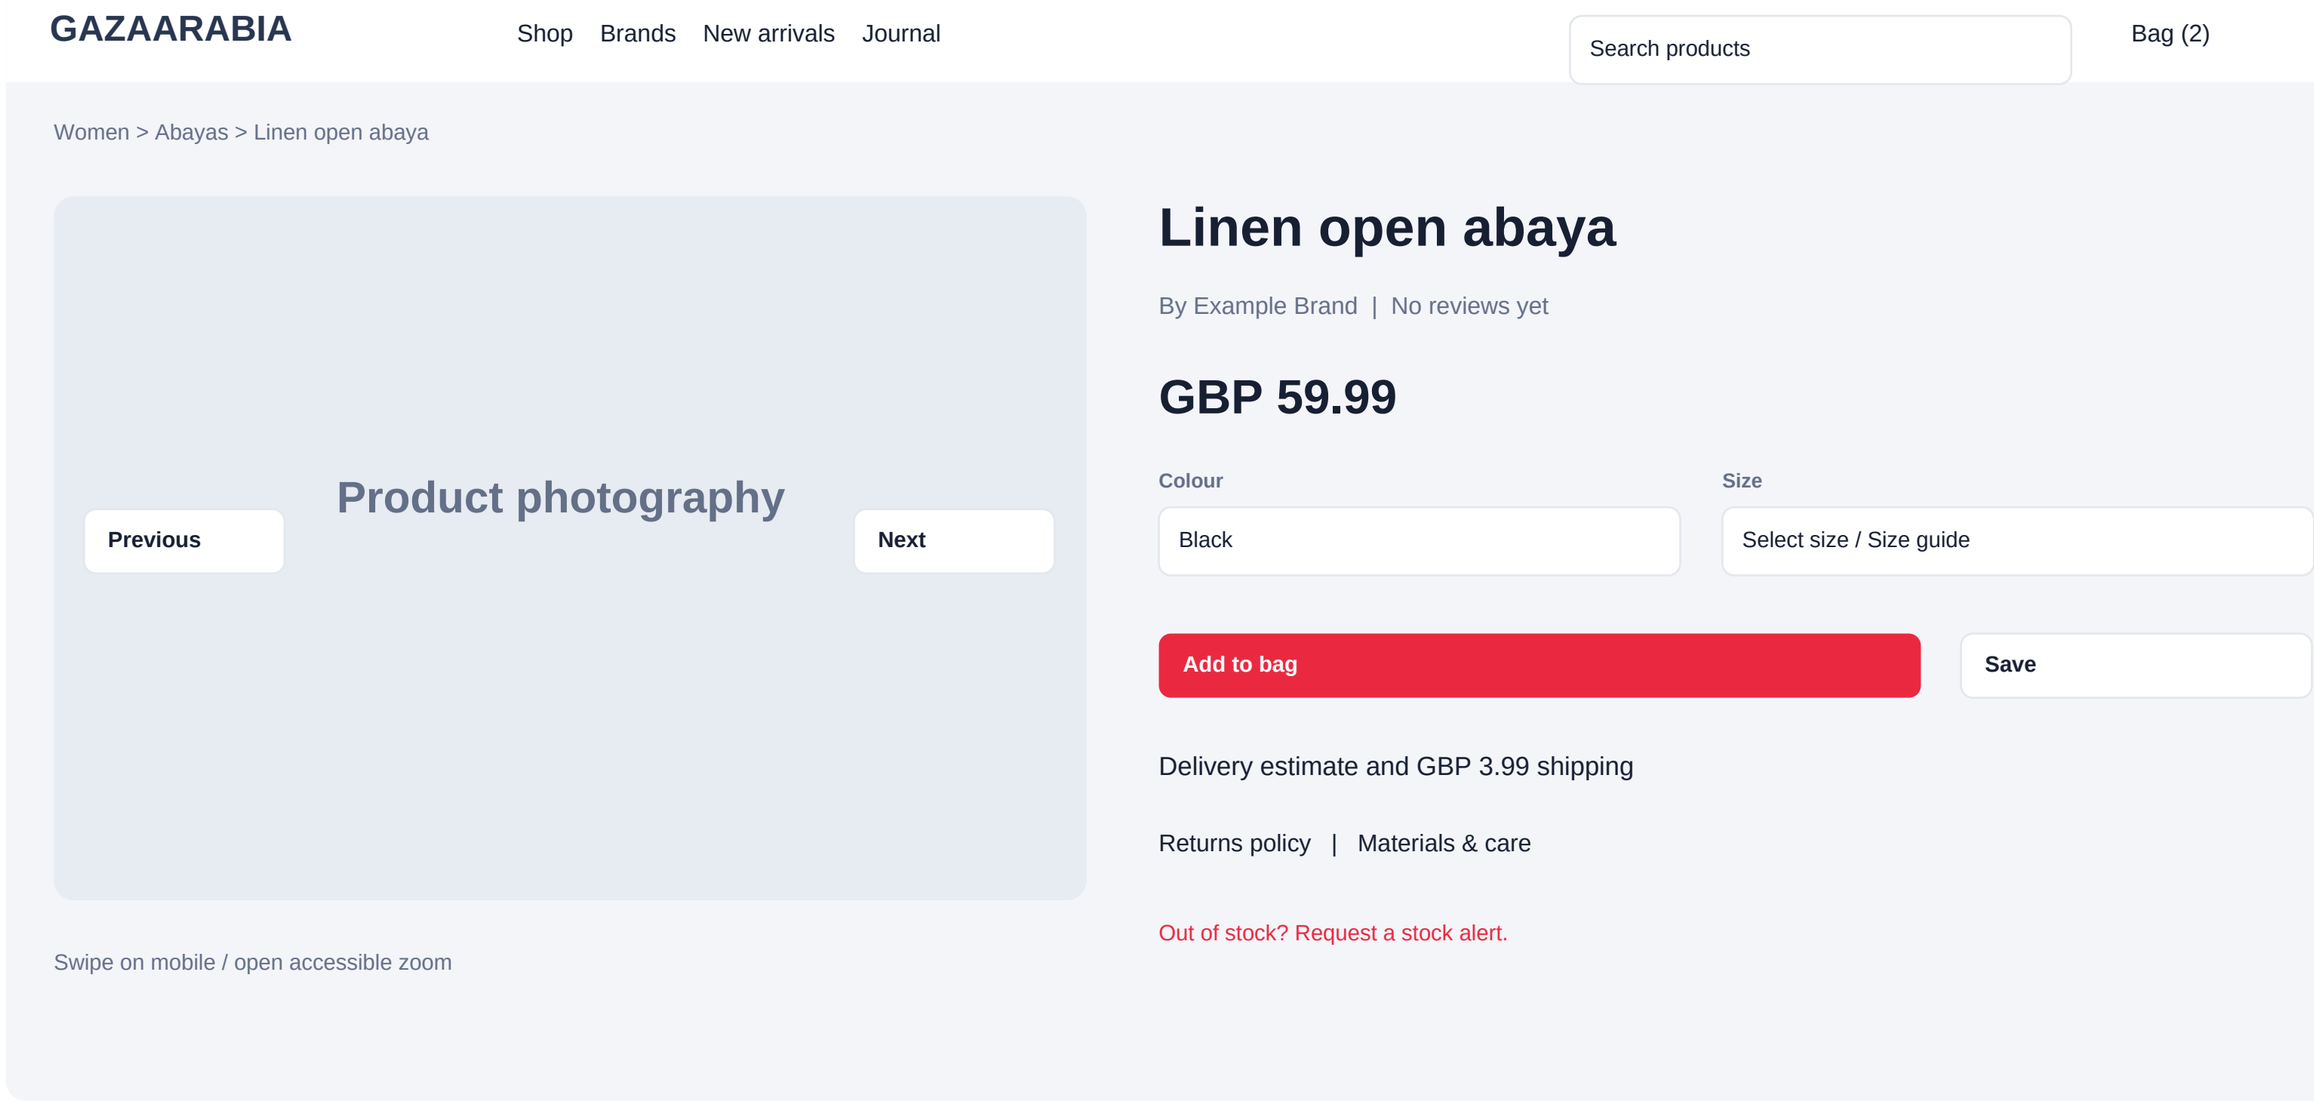

Use with checklist section 4. Example layout and demo values; adapt existing working components.

1. List unmatched payments, timing differences and failed exports.
2. Link each exception to its source record and owner.
3. Resolve or approve exceptions before locking the period.

C01 / Product detail page

Use with checklist section 1. Example layout and demo values; adapt existing working components.

1. Make imagery, size, fabric and fit information easy to find.
2. Show delivery and return responsibility before purchase.
3. Keep gallery and purchase controls usable on mobile and zoom.

C02 / Multi-seller checkout

Use with checklist section 4. Example layout and demo values; adapt existing working components.

2. Recheck replacement stock; explain unavailable size, fees and refund/reorder alternatives.
3. Check: return and replacement quantities, payments and seller balances remain linked and consistent.

Reference 1 / Products, categories and media

Developer reference. Use this only when implementing the matching checklist section.

Build the data correctly

Use stable product, variant and seller IDs. Store draft/live/archived state, SKU, category IDs, garment attributes, measurements, currency, price, stock source and ordered media. Keep one cover for non-empty media. Preserve published URL history and historic order references.

Implement the workflow

Save Draft accepts incomplete content; Publish validates required fields on the server. Autosave shows Saving, Saved or Failed. Sort categories by their full parent path and configured position. Bulk import previews valid rows, errors and intended changes before applying.

Images and video

Store originals and responsive images durably. Validate ownership, file signature, size and path. Align product/variant video fields between form, API and database. Process approved codecs and serve correct MIME/range behaviour. A successful upload must survive save, reopen and deployment.

Test before closing

Try multi-image upload, cover change/delete, variant deletion, invalid category, duplicate SKU, interrupted save, video playback/seek and an old shared product URL. Drafts must remain absent from public detail/list/feed/sitemap routes.

Where to inspect first

Earlier source pointers: seller product handlers; MediaUploader.tsx; VariantVideoUploader.tsx; ProductDetails.tsx; category APIs; prisma/schema.prisma. Confirm current equivalents before editing. The earlier public source was not verified as the deployed commit.

Reference 2 / Connected stores and reliable updates

Developer reference. Use this only when implementing the matching checklist section.

Connection record

Store platform, external store ID, capabilities, protected credential reference, selected products, external-to-internal IDs and per-field ownership. Map external categories before publication. Show which website controls stock, price, description and imagery.

Order flow

Verified payment creates seller orders. A durable job sends each order to its correct store with a stable key. Store the external acknowledgement. Tracking updates attach to the correct parcel. Agree cancellation/refund ownership and payment labels per connector.

Events and recovery

Verify event signatures; reject unauthorised events. Prevent duplicate processing with persistent unique keys. Handle stale/out-of-order updates where possible. Use retries with backoff and a failed-job queue. Reconcile regularly to recover missed events. Show measured freshness and separate catalogue/stock/order health.

Shopify and other platforms

Get the actual Shopify rejection/configuration before changing its authorisation route. Follow the supported distribution/review process; do not promise a bypass. Verify WooCommerce variation coverage and order grouping. Add other adapters behind the same internal product/order contracts.

Test before closing

Import two products with several variants; edit stock/images/price; remove a variant; send an order twice; interrupt a connection; recover missed events; update tracking. Confirm one order effect, correct stock and a visible recovery route.

Reference 3 / Checkout, orders, shipping and returns

Developer reference. Use this only when implementing the matching checklist section.

Records and statuses

Separate buyer order, seller order, order line, parcel, return and refund. Keep payment status separate from fulfilment. Snapshot variant, seller, unit price, tax treatment, shipping, discount/funding and commission terms when an order is created.

Stock and money

Reserve stock atomically with a defined expiry. Release it on failed/expired payment and finalise once on verified payment. Handle late payment success after expiry through an explicit exception. Use integer minor units or fixed-precision decimal money and a documented rounding rule.

Shipping and customer information

Calculate each seller delivery charge and threshold on the server. Use one approved configuration for product page, header, policies, checkout and emails. Show separate parcels and delivery estimates before payment. Keep delivery responsibility and seller identity clear.

Partial refund

Refund the originally paid line allocation, plus the policy-approved shipping/tax treatment. Reverse its original discounts, commissions, funding, rewards and creator amounts under agreed rules. Track remaining refundable amount. Do not recalculate historic orders from current prices.

Test before closing

Use a two-seller basket, last available unit, failed payment, repeated callback, partial shipment and partial refund. GBP 60 minus GBP 49.99 must display GBP 10.01. Two buyers must not both obtain the last unit.

Reference 4 / Accounting, settlement and exports

Developer reference. Use this only when implementing the matching checklist section.

Agree the business rules

The accountant confirms agent/principal arrangements, tax, invoice issuer, commission basis, fees, shipping treatment and payout eligibility. Record the agreement/version used on each order. Do not treat all customer spending as platform income.

Ledger and documents

Keep balanced journal entries and seller balances linked to orders and provider records. Separate seller money, platform income, fees, refunds, discounts, creator liabilities, rewards and approved impact contributions. Issue appropriate commission invoices/credit notes and seller statements.

Reconciliation and close

Match internal records to provider charges/refunds/transfers/payouts and bank evidence. Distinguish timing differences from unexplained mismatches. Assign an owner, resolve or approve exceptions, then close the period. Correct posted history with traceable adjustments and appropriate permission.

Seller view and accounting sync

Show pending, available, held and paid funds. Statement: opening balance + movements - payout = closing balance. Link every deduction and payout. Export approved documents/journals with stable external IDs, visible status and safe retries. Choose the accounting system and mapping with finance.

Test before closing

Reconcile a paid order, seller/platform discount, partial refund, failed payout and accounting export retry. Repeated export must not double-post. Label profit as estimated when costs are incomplete; prevent restricted staff from adjusting balances.

Reference 5 / Promotions, membership and creators

Developer reference. Use this only when implementing the matching checklist section.

Promotion setup

Define seller/platform owner, eligible products/variants, fixed/percentage benefit, minimum spend, dates/timezone, usage limit, budget, funding and combinations. Show the buyer preview and payer before activation. Sellers can discount only their own eligible items.

Checkout and refunds

Evaluate offers on the server. Reserve limited budget/use atomically; release on expiry/failure; redeem once on paid confirmation. Snapshot line allocations and terms. Example: GBP 60 from A plus GBP 40 from B, with A 10% off, gives GBP 94 before delivery. Refund original allocations.

Campaigns and creators

Admin sets campaigns; sellers accept terms and submit products. Keep approvals/rejection reasons. For creators record invitations, accepted commission basis, attribution window, sample inventory/cost, tracking, deliverables and content rights. Samples are not paid retail sales; refunds adjust commission once.

Later features

Membership needs a reward ledger for pending/available/spent/reversed balances, expiry and funding. Bundles need per-line refund allocation. Early-access drops need server-enforced eligibility and genuine availability. Customer messages need preferences, frequency caps and purchase suppression.

Test before closing

Test mixed sellers, simultaneous final coupon use, offer expiry, duplicate payment, partial refund, creator reversal and reward redemption. Reports must distinguish attributed sales from profit and unsupported claims of incremental sales.

Reference 6 / Fashion storefront, blogs and search

Developer reference. Use this only when implementing the matching checklist section.

Premium storefront

Use consistent imagery, product-card proportions, spacing and typography. Build editable editorial collections, outfit relationships and occasion edits. Retain Gazaarabia assets. Use brand stories while keeping one service experience. Curate recommendations first; evaluate advanced AI when data supports it.

Fit and discovery

Store factual length, lining, opacity, sleeve, neckline, fabric, stretch and garment measurements by brand/variant. Size guidance must explain its basis and allow manual choice. Search uses canonical taxonomy, synonyms and available sizes. Saved outfits do not reserve stock; shared boards need revocable links.

Blog repair

Compare original paste, editor, save request, stored article and public output. Restore missing media separately from CSS. Use supported blocks with managed background images and server sanitisation. Keep one page template, a safe excerpt in cards, draft/review/schedule states and revision recovery.

SEO, social and feeds

Use shared canonical routes, permanent redirects, unique metadata, correct seller-brand structured data and real links. Publish only eligible URLs in scalable sitemaps. Align stock, prices, images and URLs in shopping feeds. Check social previews, actual indexability and Search Console where access exists.

Test before closing

Publish a styled article with inline/background images; reopen on mobile; change its URL; verify redirect, excerpt and sitemap. Test search availability, no results, saved outfit sharing and missing fit data. No confident size recommendation is shown without supporting measurements.

Reference 7 / Permissions, safety and operations

Developer reference. Use this only when implementing the matching checklist section.

Seller and staff access

Resolve seller identity and fail closed before querying data. Check ownership on every read, write, export and background job. Use seller-scoped team roles and separate platform support, catalogue, growth and finance permissions. Review affiliate/ambassador route checks.

Audit and sensitive changes

Record actor, action, target, time, reason and safe change summary for role, approval, refund, payout and adjustment actions. Protect bank/permission changes with appropriate verification. Revoke sessions/connector credentials as required. Do not expose tokens or unnecessary buyer data in logs.

Uploads and authored content

Trace upstream protections. Authorise asset ownership, inspect file signatures, enforce limits/path containment and generated filenames. Sanitise server-side HTML/URLs and scope supported styles. Test malicious fixtures in isolation; do not broadly disable protection to make a template render.

Jobs, backups and monitoring

Use durable jobs, bounded retries, failed-item queues and safe repeatable operations. Monitor order/stock/payment/media errors with correlation IDs and owners. Back up database/media/configuration, agree recovery objectives and demonstrate restore. Verify the actual production branch, host and release baseline.

Retention and future markets

Define customer export/deletion, audit/financial retention and token revocation. Add currency, language or physical collection only when market operations and return routes exist. Existing orders retain original currency and terms. Native apps and new infrastructure need a measured business case.

Reference 8 / Test, measure and release

Developer reference. Use this only when implementing the matching checklist section.

Critical journey

Test manual and connected sellers: create draft -> publish -> browse -> reserve -> pay -> seller dispatch -> track -> return/refund -> settle. Include mixed sellers, concurrent last unit, repeated events, disconnected store, partial parcels and late payment success.

Mobile and usability

Test narrow layouts, 200% zoom, keyboard focus, named controls, touch gallery, error recovery and slow network. One dialog at a time. Browser Back restores meaningful navigation. Reserve image space and measure loading/interactions rather than inventing performance scores.

Analytics and messaging

Choose one analytics event owner. Define item/order IDs, currency and values for product view, basket, checkout, purchase and refund. Count verified paid purchases once. Correct query-string paths and referral response/cookie handling. Verify no-choice/reject/selective/revoked preference behaviour and real newsletter subscription.

Release record

For each checklist item record Done, Blocked or Still to do, plus the implementation link and evidence. Test in staging, review migrations, preserve IDs/URLs/history, document rollback/recovery, smoke-test after deployment and reconcile representative money movements.

Evidence and reference boundary

Earlier public source: hafiz011/Gazaarabia at c248f6e730bf20ffbc4977bed1176aee67760aeb; deployment equivalence remains unverified. ASOS/JD are public feature references, not private system specifications. The earlier original bugs must be reproduced against the current site before being marked fixed.

Reference 9 / Customer journey implementation

Developer reference. Use this only when implementing the matching checklist section.

Guest checkout, shopping bag and preferences

Use a prominent guest route and optional post-purchase account linking after email verification. Guest order access requires a secure expiring link or verification code, not order number alone. Merge saved bags safely; keep selected variants but recheck stock/prices. Save size/length/follow preferences and apply notification choices without turning them into fixed sizing claims.

Payment recovery and address entry

Offer provider-supported express methods without skipping delivery/eligibility checks. Address lookup needs manual fallback. Preserve non-sensitive entered data after errors. Reuse the same checkout/order attempt, check provider outcome after timeouts, and retry only when safe. Never retain raw card details or create duplicate charges/orders.

One order centre and one support route

Link buyer order, seller orders, parcels, return/refund timeline and support cases. Store problem type, affected lines/parcel, evidence, owner, response target and escalation. Guests receive the same verified case access. Route to seller internally; Gazaarabia owns customer communication and admin escalation. Show an honest update date/next step rather than an unsupported delivery promise.

Cancellations, corrections and exchanges

Check live fulfilment and connector capability before allowing changes. Lock or validate competing dispatch/cancellation actions and obtain source-store acknowledgement. An exchange links the original paid line, return and replacement variant; define reservation, expiry, dispatch trigger, fees and price differences. If unavailable, offer an explicit refund/reorder route. Show policy-approved costs, return destination and progress before confirmation.

Brand profiles and completion tests

Present approved brand story/collections in the same Gazaarabia layout with seller responsibility clear. Follow/unfollow is reversible; notification preferences and frequency caps apply. Test guest verification, bag merge, address fallback, payment timeout/retry, partial parcels, a lost-parcel case, cancellation racing dispatch, unavailable replacement size and return-fee disclosure. Exchange stock, refunds, rewards and seller balances must reconcile once.
